Administrative assistant : Sumamo

Aim and Scope
Journal of DIMENSI is a peer-reviewed journal devoted to the applications of architecture, sustainable built environment, architectural history, urban design and planning, as well as building structures. We accept national and international original research articles which are free of charge at this moment. The manuscript will be reviewed by two independent national or international reviewer boards who are in their expert field.

DIMENSI is published twice a year, in July and December, by the Institute for Research and Community Services, Petra Christian University, Surabaya, Indonesia. DIMENSI will be distributed to other universities, research centers, and international editorial boards as well as to regular subscribers.

DIMENSI: Jurnal Teknik Arsitektur was named from May 1980 to July 2006, then, the name has been changed to DIMENSI: Journal of Architecture and Built Environment since Vol. 36 No. 2 December 2008.

Editorial and Administrative Address:
Institute of Research and Community Outreach, Petra Christian University,
Jl. Siliwangi Kerto 121, 131, Surabaya 60236, Indonesia.
Phone: (031) 849-8300/849040, extension 3139-3147. Fax: (031) 84936418, 8492562

Information for DIMENSI Article Contribution

The Editorial Board welcomes articles, research reports that have never been submitted for consideration nor published elsewhere.

The writing guidelines are as follows:

1. Manuscripts must be in English, typed in MS Word, single-spaced, not more than 15 pages (including figures and tables), and email to Chief Editor e-mail: dannysm@ipetra.ac.id

Or E - Journal
http://dimensi.ipetra.ac.id

2. The heading should be: (1) not more than 12-word; (2) the contributor(s); (3) the complete affiliation(s) and address(s), and (4) separate page.

3. An abstract of not more than 150 words should be at the beginning of the manuscript and is followed by key words: .........., ...........

4. Introduction and other headings should be marked clearly. First paragraph of each heading and subheading should not be indented. The second paragraph should be indented by 5 points. The International system of units (SI units) should be applied. Equations should be given on separate lines with the equation number in parentheses at the right margin.

5. All figures must have number and place under the figure if the figure is cited then the first contributor’s name as the resource must be stated. (Figure 1. Abcde. source: abcd).

6. All tables are given in SI number on the top right. The tables are numbered consecutively and should not duplicate data found elsewhere in the manuscript.

7. Acknowledgments of collaboration or preparation may be included before the references.

8. All references should conform to the following format:

   a book

   a journal (with 2 to 5 authors):

   a journal (with 5 more authors):

   a conference:

9. Appendixes are not to be permitted to the journal (all figures and tables should be included in the body text).

10. Authors are in charge of obtaining permission to reproduce any of figures and tables used from other copyright owners or publishers.

11. Corresponding author’s e-mail must be given for more than two authors and up in the manuscript.

12. Authors are urged to download and use the DIMENSI Journal template directly from the website: (http://dimensi.ipetra.ac.id)

ABSTRACT

The Cardiovascular diseases have become the top killer since 1970 worldwide. And in 2005, it was recorded the present of 5.7 million stroke survivors. And healing stroke and its related complications required much more considerable time. So the patients’ wards quality especially related to wall colour become very important for the patients' recovery. The study was conducted with exploratory methods combining visual methods of research and Luscher colour test. Series of interviews were conducted to gather the users’ perception. And it was found on that blue wall colour calmed the medical personals, patients, and their family. The most soothing Blue colour variant according to respondents was the Artic Blue (hue 9.8B, value 7.4 and chroma 5.6).

Keywords: Wall Colour, Perception, Stroke Patient’s Ward

INTRODUCTION

Cardiovascular disease is the first killer in the world since 1970. In 2005, the number of cardiovascular disease (CVD) mortality (especially coronary heart disease, stroke, and rheumatic heart disease) rose globally to 17.5 million from 14.4 million 1990 of these, 7.6 million associated with coronary heart disease and 5.7 million for stroke, especially in the countries with low and middle income (Valentin & Bridget (ed), 2010). Because of the considerable time needed for healing stroke and its complications the quality of space especially the wall colour would impact the patient's psychological and the total healing (Edge, 2003, Valentin & Bridget, 2010).

Anderson (2008) recommended the need for inpatient wards design improvements in the aspects of the rooms’ size, noise, light, storage, temperature, colour, small rooms and social spaces provisions. And because of the colour as one of the aspect to improve, the research further pursued the impact of the wall colour on the patients and its families. The research questions asked in were:

• Did the inpatient wards’ wall colour impact the patients and other users?
• Did the blue colour calm the patients (according to the patients, patients’ family and healthcare team)?
• From four blue colour variants, which colour calmed patients the most?

PREVIOUS RESEARCH ON HUMAN PERCEPTION ON THE WALL COLOUR

Perception was a brain activity that organize, identify and interpret sensations to create a mental representation (Schacter, et al, 2009). Factors influencing the perception were other expectations, past experience and psychological circumstances, involving people, objects or events occurring in certain place, time, and atmosphere.

On the other hand, Dilani (2009) revealed that the negative impact of the physical environment that abandoned patient's psychological, in forms of anxiety, depression, high blood pressure, sleeplessness, and an increase in the need for analgesics. Novak & Richardson (2012) also found that stress affected the emotional state of the patient and health outcomes. On the other hand, the blue colour was interpreted as a cool colour, and providing peace of mind, supporting relaxation and positive impact (Novak & Richardson, 2012, Birren, 2010). Blue was found also to cause the human body releasing soothing hormones, especially strong blue sky. And one particular blue (Cardiac Blue) was often to calm patients in the cardiac unit (Kopacz, 2004).

METHODOLOGY

Research method was prescribed incorporating earlier tests, such as: Luscher Color Test (1969) and Franz, et.al. (2005). Luscher Color Test (1969) was a person’s preference test for some colour using coloured cards. The coloured cards were selected from most preferred to least preferred. Franz, et.al. (2005) created several 3-dimensional model of the room with a certain colour variants. The pictures were given to respondents. The respondents selected the most preferable and described the colour with semantic descriptions scale. Combining both methods, the research was conducted at the Pavilion for Stroke Patients, in Hospital Y, Surabaya, Indonesia involving 14 respondents, consisting of two doctors, three nurses and nine patients and patients’ families.
The respondents were asked with a set of blue colour panel. The blue colour was chosen for calming the patient, based on Novak & Richardson (2012). Four variants of blue colour were selected, such as: Arctic Blue, Everest Blue, Cool Blue, and Teardrop (Figure 1). Hue, value, and chrome of each variant were described as: 9.8 Blue 7.4 / 5.6 (Arctic Blue), 3.3 Purple Blue 6.2 / 7.3 (Everest Blue), 7.3 Blue 7.6 / 3.4 (Cool Blue) and 0.6 Purple Blue 8.2 / 1.7 (Teardrop). All the colours variants chosen from Nippon Paint products. To improve the respondents’ visualization on the wall colour, three-dimensional of the inpatient wards was created. The pictures were fixed to the four colour A3-sized colour panel (293 cm x 420 cm) (Figure 2).

RESULTS and DISCUSSION

Results of the study stated the blue colour calmed patients to rest, as expressed by Luscher, (1969) and Kopacz (2004). Respondents perceived the blue colour as calming, cooling, refreshing, and reminiscent of sky colour. The majority of respondents (86%) chose Artic Blue as the most calming colour. Other respondents chose Cool Blue (7%) and Everest Blue (7%) colours (Figure 5). The order of blue colour variants from most calming to the least one to be presented in Table 1. Supporting reasons why Artic Blue colour was most calming were: it was quite soft, it did not blister, it did not collect dirt, and it did not cause agitation to patients.

The Artic Blue and Cool Blue was analysed as the most calming colour because of:

- The two blue colour variants showed that the Purple Blue (PB) hue on the Munsell atlas created more calming impacts than Blue (B) hue.
- The value of the Artic Blue and Cool Blue were in the range of 7.4-7.6 on a scale of 10. They were more related to clear sky that calmed the respondents.
- The chrome of two colours were 3.4-5.6 on a scale of 6. It mean that the colour consisted more blue saturation rather than grey.

Therefore, Arctic Blue could be used effectively for inpatient wards especially for stroke of cardiac units.

(Source: author)

**CONCLUSION**

Of the four blue colour variants investigated, Arctic Blue was the most calming colour, for stroke units users in Y Hospital in Surabaya. The Arctic blue colour had a value of 7.4-7.6 on a scale of 10, and chroma 3.4-5.6 on a scale of 6. However, further research on the user’s perception of the colour could be expanded for the whole interior, such as: ceiling, furniture, etc. On the other hand, other blue colours could be researched for other purposes such as educational buildings, etc.

**ACKNOWLEDGMENT**

This research was funded by Hibah Internal scheme of Lembaga Penelitian dan Pengabdian Masyarakat (LPPM) Petra Christian University in 2014. Special thanks to Professor Djwantoro Hardjito as the Vice Rector of Petra Christian University and Professor Lilianny Arifin Sigit the former of Chairman of LPPM.
