

**ICAMIMIA**

INTERNATIONAL CONFERENCE ON ADVANCED MECHATRONICS,  
INTELLIGENT MANUFACTURE, AND INDUSTRIAL AUTOMATION

# BOOK of ABSTRACT

## ICAMIMIA 2017

INTERNATIONAL CONFERENCE ON ADVANCED MECHATRONICS,  
INTELLIGENT MANUFACTURE, AND INDUSTRIAL AUTOMATION

**12-14<sup>th</sup> October 2017**

Gedung Pusat Robotika Institut Teknologi Sepuluh Nopember  
Surabaya, Indonesia

Organized by:

Technical Supported by:

Sponsored by:

Supported by:

**International Conference On Advanced  
Mechatronics, Intelligent Manufacture and  
Industrila Automation (ICAMIMIA) 2017**

Surabaya, 12-14<sup>th</sup> October 2017

*Disruptive and Robust Innovation for  
Mechatronics Technology*

Program and Abstract

**CONTENTS**

WELCOMING SPEECH FROM GENERAL CHAIR	4
OPENING SPEECH FROM RECTOR OF ITS	6
CONTENTS	8
COMMITTEE	18
CONFERENCE PROGRAM	20
SCHEDULE OF PARALLEL SESSION ICAMIMIA 2017	22
REGULATION OF PARALLEL SESSION	24
CHAIR OF PARALLEL SESSION	25
ROOM LAYOUT	26
Keynote Speaker 1	27
On the 3 <sup>rd</sup> -order Jerk-like Control Methods of the Proportional-Integral-Derivative Active Force Control and its Application to Low-level Control of 3D- High Speed Vehicle Motion	
Endra Pitowarno	
Keynote Speaker 2	28
Siemens Contribution in Indonesia'S Infrastructure	
Pascal Dricot	
Keynote Speaker 3	29
The Development of Neural Networks applications from Perceptron to Deep Learning	
Ahmad Jobran Al-Mahasneh, Sreenatha G. Anavatti*, and Matthew A. Garratt	
Keynote Speaker 4	30
The Rise of Smart Machines – Integrated Industrial IoT Machines is Smart Manufacturing	
Alfina Wijanarno	
<i>Rockwell Automotion Southeast Asia PTE. Ltd.</i>	
Keynote Speaker 5	31
Mahardika Pratama	
<i>Nanayang Technological University, SINGAPORE</i>	
Keynote Speaker 6	32
Research and Development on Vehicle Design for Strategic Mission: Bhimasena's Role	
Aris Budiarto	
<i>PT. Bhimasena Research and Development, INDONESIA</i>	

<b>CONTROL AND MODELLING (CM)</b>	33
CM-1570391777	34
A Study of Energy Consumption in Battery/Super Capacitor Hybrid System based on Optimized Driving Strategy	
Bonhyun Gu <sup>1</sup> , Sukwon Cha <sup>1</sup>	
CM-1570394790	35
Economic Plant Wide Control in Debutanizer Column	
Toto Haksoro <sup>1</sup> and Januar Dinar, Pratama <sup>1</sup>	
CM-1570395984	36
Control of photovoltaic system connected to DC bus in all-electric ship	
Adi Kurniawan <sup>1</sup> and Eiji Shintaku <sup>1</sup>	
CM-1570397845	37
Design of Fault Tolerant Control System on Variable Speed Wind Turbine with Sensor Fault	
Katherin Indriawati <sup>1</sup> , Alief Ghazi <sup>1</sup> , Bambang W <sup>1</sup> and Ali Musyafa <sup>1</sup>	
CM-1570398031	38
Fuzzy Logic Control for EC (Electrical Conductivity) In Tomato Cherry Hydroponics Systems	
Hendra Cordova <sup>1</sup>	
CM-1570399232	39
PID Controller Design for SSV BRP TARLAC (LD-601) Ship Heading Using Ziegler Nichols Tuning Method	
Didik Khusnul Arif <sup>1</sup> , Moch. Ardi Firmansyah <sup>1</sup> , Dieky Adzkiya <sup>1</sup> and Iratdya Winggari <sup>1</sup>	
<b>DESIGN AND SYSTEM (DS)</b>	40
DS-1570381258	41
Symbiotic Organisms Search with the Feasibility-Based Rules for Constrained Engineering Design Optimization	
Doddy Prayogo <sup>1</sup> and Min-Yuan Cheng <sup>2</sup>	
DS-1570392852	42
Enhanced Symbiotic Organisms Search (ESOS) for Global Numerical Optimization	
Doddy Prayogo <sup>1</sup> , Foek Tjong Wong <sup>1</sup> , and Steven Sugianto <sup>1</sup>	
DS-1570393301	43

Comparative of Feasibility Study Between Diesel Mechanical Propulsion System and Combination of Diesel or Electric Propulsion System on Offshore Patrol Vessel (OPV) 80 m Eddy Setyo Koenhardono <sup>1</sup> , Rahmat Kristomi <sup>1</sup> and Amiadji Amiadji <sup>1</sup> DS-1570396178	44
IMPLEMENTATION OF GAMIFICATION TO IMPROVE BLOOD DONORS BY PEER MOTIVATION APPLICATION DS-1570396349	45
Design of Marine Cable Installation for Ocean Current Power Plant in Toyopakeh Strait-Bali Adi Kurniawan <sup>1</sup> , Irfan Arief <sup>1</sup> , Danang Cahyagi <sup>1</sup> and Mira Yosi <sup>2</sup> DS-1570396502	46
Optimization of Carbon Dioxide (CO <sub>2</sub> ) Captured and Distribution for Enhanced Oil Recovery Totok R. Biyanto <sup>1</sup> , Muhammad Khalil <sup>1</sup> , and Gabriella Putri Dienanta <sup>1</sup> DS-1570397426	47
Virtual Sasando Using Leap Motion Controller Ridho Rahman Hariadi <sup>1</sup> , Darlis Herumurti <sup>1</sup> , Anny Yuniarti <sup>1</sup> , Imam Kuswardayan <sup>1</sup> , and Nanik Suciati <sup>1</sup> DS-1570397790	48
Nearest Neighbour Based Task Allocation with Multi-Agent Path Planning in Dynamic Environments Sumana Biswas <sup>1</sup> , Matthew Garratt <sup>1</sup> , and Sreenatha Anavatti <sup>2</sup> , DS-1570399186	49
Review and Comparison Of DC-DC Converters For Maximum Power Point Tracking System In Standalone Photovoltaic (PV) Module Pressa Surya <sup>1</sup> <sup>1</sup> Muhammadiyah University of Gresik & Politeknik Sakti, Indonesia DS-1570399561	50
Comparison Method of Flower Pollination Algorithm, Modified Particle Swarm Optimization and Perturb & Observe in MPPT Coupled Inductor Sepic Converter on DC Microgrid Isolated System Farid Dwi Murdianto <sup>1</sup> , Alfis Syah Laili Hermawan <sup>1</sup> , Ainur Rofiq Nansur <sup>1</sup> , and Rangga Eka Setiawan <sup>1</sup> DS-1570399670	51
Comparison Method of MPSO, FPA, and GWO Algorithm in MPPT Sepic Converter Under Dynamic Partial Shading Condition Farid Dwi Murdianto <sup>1</sup> , Moh. Zaenal Efendi <sup>1</sup> , Rangga Eka Setiawan <sup>1</sup> , and Alfis Syah Laili Hermawan <sup>1</sup>	

DS-1570402052 Design Biomass Dryer by Using Heat Release Of Boiler Combustion Totok Soehartanto <sup>1</sup> <b>ENERGY (E)</b>	52
E-1570386080 Design and Simulation of Synchronous Generator Excitation System Using Buck Converter at Motor-Generator Trainer Model LEM-MGS Rifdian Indrianto Sudjoko <sup>1</sup> and Purwadi Darwito <sup>1</sup> E-1570394117	53
Integration Power System from Solar Power Plant with Electricity Grid by Summing Amplifier using Smart Technology Aqidatul Izzah <sup>1</sup> E-1570396897	55
Analysis of Unbalanced Load Effect of Three Phase Transformer Feedback 61-103 Performance on the Various Connection Windings Sardono Sarwito <sup>1</sup> , S. Semin <sup>1</sup> , and Muhammad Hanif <sup>1</sup> E-1570397358	56
Analysis of Transient Response First Order and Second Order Theory in Pneumatic Control System using Feedback Instrument Type PCM140 Sardono Sarwito <sup>1</sup> , S. Semin <sup>1</sup> , and Taufiq Hidayaturrahman <sup>1</sup> E-1570397719	57
Transient Stability Analysis of General Cargo Shipboard Power System Indra Ranu Kusuma <sup>1</sup> , Semin Semin <sup>1</sup> , and Muhammad Badrus Zaman <sup>1</sup> E-1570399494	58
Design Blade Pitch Controller of Wind Turbine for Load Frequency Control (LFC) using Improved Differential Evolution Algorithm (IDEA) Dwi Lastomo <sup>1</sup> , Slamet Budiprayitno <sup>1</sup> , Andri Ashfahani <sup>1</sup> , and Herlambang Setiadi <sup>2</sup> E-1570399621	59
Root Finding - Newton Rhapson Method as Maximum Power Point Tracker Algorithm for Static Photovoltaic Fauzi Adhim <sup>1</sup> , Ciptian Priyananda <sup>1</sup> , and Lucky Rahayu <sup>1</sup> E-1570399907	60
A Technique to Track Maximum Power-Point of Grid-Connected Single-Stage Inverter Photovoltaic System	61
<b>INFORMATION AND COMPUTATIONAL ENGINEERING (IC)</b>	62
IC-1570384612	63

A Data Hiding Approach Using Enhanced-RDE in Grayscale Images IC-1570394799	64
Rain Water Algorithm: Newton's Law of Rain Water Movements During Free Fall and Uniformly Accelerated Motion Utilization Totok R. Biyanto <sup>1</sup> , Ahmad Hasinur Rahman <sup>1</sup> , Gabriella Putri Dienanta <sup>1</sup> and Titania Bethiana <sup>1</sup> IC-1570397431	65

### Enhanced Symbiotic Organisms Search (ESOS) for Global Numerical Optimization

Doddy Prayogo<sup>1</sup>, Foek Tjong Wong<sup>1</sup>, and Steven Sugiarto<sup>1</sup><sup>1</sup>Petra Christian University, Indonesia

Email: prayogo@petra.ac.id

#### ABSTRACT

Symbiotic organisms search (SOS) is a simple but effective metaheuristic algorithm to solve global numerical optimization problems. Many research has been done to propose few versions of SOS to improve the performance of conventional SOS. This research proposes a new version of SOS called Enhanced Symbiotic Organisms Search (ESOS) for global numerical optimization. We propose modification of SOS by improvising the parasitism phase so that it can produce a more optimal solution. The performance of ESOS is verified on 26 benchmark functions and 1 engineering design problem, then compared with existing optimization methods. Based on the research results, it can be concluded that ESOS is able to demonstrate good competitive, and effective performance for global optimization.

**Key words:** metaheuristic algorithm; Symbiotic Organisms Search; global numerical optimization; structural engineering design

#### ABSTRACT

The modern offshore patrol vessel is designed to carry out various missions in the management of economic exclusion zones, thus having some speed of service. For example, the speed for slow patrol is 10 knots, regular patrols 18 knots and chasing 22 knots. This condition requires a flexible propulsion system, which is combination of mechanical and electrical propulsion system. The application of this propulsion system to the OPV can increase the load factor of the propulsion system, resulting in lower fuel consumption than when using a mechanical propulsion system. Based on feasibility analysis results, the choice of combination of mechanical and electrical propulsion system is more advantageous than mechanical propulsion system, although investment and maintenance cost is higher. Therefore, patrol boats should use combination of mechanical and electrical propulsion system.

**Key words:** DMP propulsion system; CODGE propulsion system; Feasibility Study; Offshore Patrol Vessels 80 m; Engine propeller matching analysis.

**Abstract**—Symbiotic organisms search (SOS) is a simple yet effective metaheuristic algorithm to solve a wide variety of optimization problems. Many studies have been carried out to improve the performance of the SOS algorithm. This research proposes an improved version of the SOS algorithm called the “enhanced symbiotic organisms search” (ESOS) for global numerical optimization. The conventional SOS is modified by implementing a new searching formula into the parasitism phase to produce a better searching capability. The performance of the ESOS is verified using 26 benchmark functions and one structural engineering design problem. The results are then compared with existing metaheuristic optimization methods. The obtained results show that the ESOS gives a competitive and effective performance for global numerical optimization.

**Keywords**—metaheuristic algorithm, symbiotic organisms search, global numerical optimization, structural engineering design

## I. INTRODUCTION

In the last few decades, global numerical optimization has become an interesting and challenging field of study to develop. Many of the optimization problems were solved by gradient-based optimization methods. However, technology has advanced rapidly in the last few decades, causing optimization problems to be varied and difficult to resolve. As a result, gradient-based optimization methods become less efficient in solving some complex problems. Due to these limitations, researchers have sought to find other optimization methods that are more effective than gradient-based optimization methods.

Recently, numerous metaheuristic optimization methods have been extensively researched and have evolved into potential alternatives to gradient-based methods. A “metaheuristic” is defined as an algorithmic framework that has a particular pattern, often nature-inspired, that iteratively simulates a set of randomly generated solutions to achieve better optimal solutions [1]. Notable examples of metaheuristic algorithms include the genetic algorithm (GA) [2], simulated annealing (SA) [3], particle swarm optimization (PSO) [4], differential evolution (DE) [5], ant colony optimization (ACO) [6], harmony search (HS) [7], artificial bee colony (ABC) [8], firefly algorithm (FA) [9], cuckoo

search (CS) [10], and teaching–learning-based optimization (TLBO) [11].

However, there are limitations of existing metaheuristic methods. For example, GA uses complicated operators (on selection and crossover), often trapped in local optima, and has a weak local search capability [12]. PSO has a poor exploration capability in solving complex multimodal problems and can be easily trapped in local optima [12]. As a result, in agreement with the “no-free-lunch” theory [13], new metaheuristic optimization methods must be developed to solve specific and more complex optimization problems [14-16]. Furthermore, there is a growing number of studies in combining metaheuristic algorithms with other techniques to handle advanced problems [17-20].

Symbiotic organisms search (SOS) proposed by Cheng and Prayogo [21] is a promising new metaheuristic method that can produce a better solution in comparison with other traditional metaheuristic methods such as GA, PSO, and DE. This method simulates symbiotic behaviors between living creatures of different species in an ecosystem with the goal of survival. Although quite new, SOS has been utilized to solve many difficult optimization problems. In this research, an improved version of SOS is proposed called “enhanced symbiotic organisms search” (ESOS), which modifies the mechanism of the parasitism phase to produce a better exploration strategy. The proposed ESOS method is then used to solve complicated mathematical benchmark problems and one structural engineering design problem.

## II. METHODOLOGY

### A. Brief Introduction to the SOS Algorithm

First developed by Cheng and Prayogo [21], SOS is a metaheuristic algorithm inspired by the symbiotic relationships among organisms in their ecosystem as illustrated in Fig. 1. Initially developed for continuous numerical optimization, SOS has been widely used for solving various optimization problems in a variety of research areas. Similar to well-known metaheuristic algorithms, SOS comprise a sequence of operations that can generate potential best solutions at each iteration.

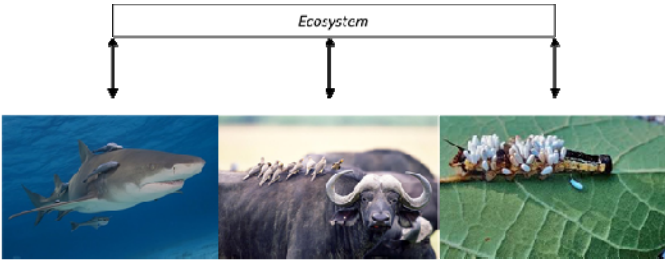

Fig. 1. Illustrations of symbiotic mutualism, commensalism, and parasitism.

The algorithm is constructed in three main phases: mutualism, commensalism, and parasitism. In the mutualism phase, two candidate solutions benefit from the interaction; in the commensalism phase, one of the candidates receives an advantage while the other candidate is not affected; and in the parasitism phase, one candidate benefits while the other is harmed. The cycle of these symbiotic interactions continues until the specific criteria are satisfied.

### B. Modification in the SOS Algorithm

Since its introduction by Cheng and Prayogo [21], SOS has been widely applied in many research fields [22-26]. The three phases that comprise the SOS structure offer unique searching characteristics [21]. For example, mutualism and commensalism benefit SOS with their good exploration capabilities, and parasitism has a strong exploiting characteristic with its cloning and random-based mutation operator. Additionally, parasitism has the capability to remove inferior solutions. Nevertheless, improving the performance of SOS has become even more necessary as the complexity of numerical problems has increased tremendously.

In this research, enhanced SOS (ESOS) is introduced as an improved version of SOS by modifying the current parasitism phase. In addition to the commonly known cloning and mutation concept, a sub-phase, called “cleptoparasitism” is introduced in the parasitism phase. The proposed sub-phase is originally adopted from the crow search algorithm (CSA) [27]. The cleptoparasitism sub-phase mimics the ingenious behavior of crows that keep their food reserves in hiding places for future retrieval. The following pseudo-code explains the mechanism of the modified parasitism phase:

```

1: Generate a uniform random number,  $rand1$ , between  $[0, 1]$

11:    Select the fittest organism between
        $cleptoparasite\_vector$  and its host
12:  end if
13: end for

```

Similar to the canonical SOS, the ecosystem passes through the mutualism and commensalism phases in sequence before entering the modified parasitism phase. The modified parasitism phase is now of two sub-phases: the original parasitism sub-phase and the cleptoparasitism sub-phase.

In the cleptoparasitism sub-phase,  $ri$  is introduced as a uniform random number with a value determined by Askarzadeh [27], as seen in (1):

$$ri = rand(0,1) \quad (1)$$

Thereafter,  $fl$  is the range of the range between the  $m$ -organism and  $(m + 1)$ -organism in a single loop. The value of  $fl$  is determined by the user taking a random number with a uniform distribution between -2 and 2. There is a possibility of random numbering for  $fl$  that results in better search performance, but the researcher has not done so due to time constraints. The definition of  $fl$  can be seen in (2):

$$fl = rand(-2,2) \quad (2)$$

The  $coef$  is the coefficient of the difference in value possessed by the best position of organism ( $x_{best}$ ) and the current position of the  $m$ -organism ( $x_m$ ), which can be seen in (3); and the new position of the  $m$ -organism ( $x_m'$ ) obtained through (4):

$$coef = ri \times fl \quad (3)$$

$$x_m' = x_m + coef(x_{best} - x_m) \quad (4)$$

### III. ESOS VALIDATION ON NUMERICAL BENCHMARK PROBLEMS

In this section, the performance of ESOS is tested through complex benchmark problems. For comparison purpose, PSO, DE, and the original SOS algorithm are employed. The experimental setting is described as follows: the population sizes of PSO, DE, SOS, and ESOS are set to 50 each; the maximum number of function evaluations is set to be 250,000; and the iteration stops only if the function evaluations exceed the maximum number allowed.

To maintain an equivalent comparison, PSO, DE, SOS, and ESOS algorithms are tested under the same conditions and

parameter settings for the four algorithms as shown in Table I. The number of ecosystems is denoted by  $n$ ;  $w$  is the inertia weight;  $c$  is the crossover rate; and  $F$  is the scaling factor. A set of 26 benchmark functions is used to evaluate the algorithms. The experiment is repeated over 30 times and the average results for mean (M) and standard deviation (SD) are recorded in Table II and Table III. Bolded numbers represent the best mean value for each function.

TABLE I. PARAMETER SETTINGS FOR NUMERICAL BENCHMARK PROBLEMS

<b>PSO</b>	$n = 50, w = 1, c_1 = 2, c_2 = 2$
<b>DE</b>	$n = 50, F = 0.4, c = 0.5$
<b>SOS</b>	$n = 50$
<b>ESOS</b>	$n = 50$

To further find out about the superiority of the ESOS compared with the original SOS algorithm, we show the convergence profiles for Rosenbrock mathematical benchmark problem in each iteration as shown in Fig. 2. The SOS algorithm has a slightly better convergence rate in comparison with the ESOS algorithm. However, as the iteration progresses to a greater value, ESOS converges faster. The ESOS and SOS algorithms found the best value of 0.13893 and 4.64578, respectively, after 1200 iterations. This proves that improvisation in one phase of the SOS algorithm produces a positive impact on the computation of more optimal results.

Fig. 2. Convergence profiles for the SOS and ESOS algorithm on Rosenbrock mathematical benchmark problem.

#### IV. PRACTICAL EXAMPLE OF STRUCTURAL PROBLEM

Practical performance of the ESOS algorithm is investigated by using 72-bar space truss structure problem. PSO, DE, and SOS algorithms are used as comparisons. For all four methods, the best weight (minimum), standard deviation, and average (mean) were obtained from 30 independent runs, with the maximum value for the function evaluation set at 50,000.

The objective of the 72-bar space truss problem is to obtain the lightest structural weight and was previously investigated by Li et al. [28]. This test problem uses two linear inequality constraints, stress ( $\sigma$ ) and displacement ( $\Delta$ ), and one design variable, cross-sectional area ( $x$ ). The following objective of design optimization on structural problem is to find a minimum weight ( $W$ ) of structures, so we can get a minimum cost of construction. The objective function for this problem can be seen in (5):

$$W = \sum_{m=1}^{N_m} L_m m_m \quad (5)$$

with  $N_m$  is the total number of truss members,  $L_m$  is the length of each truss members, and  $m_m$  is the coefficient of weight per length of truss members, as follows:

$$m_m = 2.71447x \quad (6)$$

The boundary conditions for cross-sectional area of truss ( $x$ ) can be seen in (7) and the following limitations are the design constraints for structural problem tested, that can be seen in (8) and (9) as follows:

$$64.52 \leq x \leq 2064.51 \quad (7)$$

$$g_m = \frac{\sigma_m}{(\sigma_m)_{all}} - 1 \leq 0; m = 1, 2, 3, \dots, N_m \quad (8)$$

$$\delta_{jk} = \frac{d_{j,k}}{(d_{j,k})_{all}} - 1 \leq 0; j = 1, 2, 3, \dots, N_j \quad (9)$$

In (8) and (9),  $g_m$  and  $\delta_{jk}$  are the optimization constraints for stress and displacements, respectively. For the  $m$ -th member,  $\sigma_m$  is the computed axial stresses and  $(\sigma_m)_{all}$  is its allowable. While for  $j$ -th joint on the  $k$ -th direction,  $d_{jk}$  is the computed displacements and  $(d_{jk})_{all}$  is its allowable, and  $N_j$  is the total number of joints.

Due to the symmetry of existing structures and according to previous research, these structures are divided into 16 groups of elements. The load case for 72-bar space truss problem is listed in Table IV and the structure is shown in Fig. 3. A performance comparison of the statistical results between ESOS and other metaheuristics is presented as Table V. In this table, bold texts indicate the best results. The ESOS and SOS algorithms achieve the best (minimum) weight of the structure, i.e., 1714.98 N. However, the ESOS algorithm outperforms SOS in best average and standard deviation for the weight of the structure. For best mean and standard deviation, the SOS algorithm achieves, respectively, 1717.95 N and 4.29 while the ESOS algorithm achieves 1715.90 N and 2.89.

TABLE IV. LOAD CASE FOR 72-BAR SPACE TRUSS PROBLEM

Nodes	Load (kg)		
	$P_x$	$P_y$	$P_z$
17	2267.96	2267.96	-2267.96

TABLE V. COMPARISON OF STATISTICAL RESULTS FOR ESOS AND OTHER METAHEURISTICS

Algorithms	Best	Mean	St. Dev.
PSO	5510.87	7725.08	1072.46
DE	1778.42	3193.12	990.52
SOS	<b>1714.98</b>	1717.95	4.29
ESOS	<b>1714.98</b>	<b>1715.90</b>	<b>2.89</b>

## V. CONCLUSIONS

This research proposes the ESOS method for global numerical optimization. This method modifies the conventional SOS method by implementing a new searching formula in the parasitism phase, with the intention of producing a better searching capability. We compared ESOS performance with PSO, DE, and the original SOS algorithm across 26 benchmark functions and one structural engineering design problem. The computational results and comparisons verify the superiority of ESOS in solving some complex mathematical benchmark problems better than other tested algorithms. Furthermore, for the structural problem, ESOS demonstrated consistent performance to produce optimal solutions. This is confirmed from the smaller standard deviation produced by ESOS compared with other metaheuristic algorithms including SOS. Thus, the implemented improvisation in the parasitism phase produced a large positive impact on the computational results. The ESOS algorithm delivers competitive, superior, and effective performance for global numerical optimization.
