### Focus and Scope

International Journal of Public Health Science (IJPHS) is an interdisciplinary journal that publishes material on all aspects of public health science. This IJPHS provides the ideal platform for the discussion of more sophisticated public health research and practice for authors and readers world wide. The priorities are originality and excellence. The journal welcomes high-impact articles on emerging public health science that covers (but not limited) to epidemiology, biostatistics, nutrition, family health, infectious diseases, health services research, gerontology, child health, adolescent health, behavioral medicine, rural health, chronic diseases, health promotion, evaluation and intervention, public health policy and management, health economics, occupational health and environmental health.

### Section Policies

#### Epidemiology

Risk factors, communicable disease, non communicable disease, etiology, determinant factors of health and disease, population, sample, evidence based, statistical analysis, research method, transmission, outbreak investigation, surveillance, monitoring, screening, clinical trial, exposure, specific protection, treatment, prevention, rehabilitation, trend, distribution, frequency, triangle of epidemiology, host, agent, environment, population at risk, study design, data collection, observational study, cross sectional, case control, cohort, experimental study, epidemic, endemic, pandemic, pathogenesis, mortality, morbidity, odds ratio (OR), bias, relative risk (RR), reliability, validity, incidence, prevalence, probability, random, confounding, survival analysis, regression, bivariate analysis, multivariate analysis.

## Peer Review Process

Institute of Advanced Engineering and Science (IAES) is a member of CrossCheck by CrossRef and iThenticate. IAES uses Plagiarism Detection Software – iThenticate to screen for plagiarism before publication. This journal operates a conventional single-blind reviewing policy in which the reviewer's name is always concealed from the submitting author. Authors should present their papers honestly without fabrication, falsification, plagiarism or inappropriate data manipulation. Submitted papers are evaluated by anonymous referees for contribution, originality, relevance, and presentation. Papers will be sent for anonymous review by at least three (3) reviewers who will either be members of the Editorial Board or others of similar standing in the field. In order to shorten the review process and respond quickly to authors, the Editors may triage a submission and come to a decision without sending the paper for external review. The Editor shall inform you of the results of the review as soon as possible, hopefully in 8-12 weeks. The Editors' decision is final and no correspondence can be entered into concerning manuscripts considered unsuitable for publication in this journal. All correspondence, including notification of the Editors' decision and requests for revisions, will be sent by email.

## Open Access Policy

This journal adhere to the [best practice and high publishing standards](#) and comply with the following conditions:

1. Provides immediate open access to its content on the principle that making research freely available to the public supports a greater global exchange of knowledge;
2. Allows the author to hold the copyright and to retain publishing right without restrictions;
3. Deposits content with a long term digital preservation or archiving program;
4. Uses DOIs as permanent identifiers;
5. Embeds machine-readable CC licensing information in articles;
6. Allows generous reuse and mixing of content, in accordance with CC BY-NC license;
7. Can Provide article level metadata for any indexers and aggregators
8. Has a deposit policy registered with a deposit policy registry, e.g. Sherpa/Romeo.

## Archiving

This journal utilizes the LOCKSS system to create a distributed archiving system among participating libraries and permits those libraries to create permanent archives of the journal for purposes of preservation and restoration. [More...](#)

## Publication Ethics and Malpractice Statement

Institute of Advanced Engineering and Science (IAES) is a non-profit international scientific association of distinguished scholars engaged in engineering and science devoted to promoting researches and technologies in engineering and science field through digital technology. **IAES Journals** are peer-reviewed international journals. This statement clarifies ethical behaviour of all parties involved in the act of publishing an article in our journals, including the authors, the editors, the peer-reviewers and the publisher (Institute of Advanced Engineering and Science). This statement is based on [COPE's Best Practice Guidelines for Journal Editors](#).

#### Ethical Guideline for Journal Publication

The publication of an article in a peer-reviewed International Journal of Public Health Science (IJPHS) is an essential building block in the development of a coherent and respected network of knowledge. It is a direct reflection of the quality of the work of the authors and the institutions that support them. Peer-reviewed articles support and embody the scientific method. It is therefore important to agree upon standards of expected ethical behavior for all parties involved in the act of publishing: the authors, the journal editors, the peer reviewers, the publisher and the society.

Institute of Advanced Engineering and Science (IAES) as publisher of IAES Journals takes its duties of guardianship over all stages of publishing extremely seriously and we recognize our ethical and other responsibilities. We are committed to ensuring that advertising, reprint or other commercial revenue has no impact or influence on editorial decisions. In addition, the IAES and Editorial Board will assist in communications with other journals and/or publishers where this is useful and necessary.

#### Publication decisions

The editors of the IAES journals are responsible for deciding which of the articles submitted to the journal should be published. The validation of the work in question and its importance to researchers and readers must always drive such decisions. The editors may be guided by the policies of the journal's editorial board and constrained by such legal requirements as shall then be in force regarding libel, copyright infringement and plagiarism. The editors may confer with other editors or reviewers in making this decision.

#### Fair play

An editor at any time evaluate manuscripts for their intellectual content without regard to race, gender, sexual orientation, religious belief, ethnic origin, citizenship, or political philosophy of the authors.

#### Confidentiality

The editor and any editorial staff must not disclose any information about a submitted manuscript to anyone other than the corresponding author, reviewers, potential reviewers, other editorial advisers, and the publisher, as appropriate.

#### Disclosure and conflicts of interest

Unpublished materials disclosed in a submitted manuscript must not be used in an editor's own research without the express written consent of the author.

#### Duties of Reviewers

##### *Contribution to Editorial Decisions*

Peer review assists the editor in making editorial decisions and through the editorial communications with the author may also assist the author in improving the paper.

##### *Promptness*

Any selected referee who feels unqualified to review the research reported in a manuscript or knows that its prompt review will be impossible should notify the editor and excuse himself from the review process.

##### *Confidentiality*

Any manuscripts received for review must be treated as confidential documents. They must not be shown to or discussed with others except as authorized by the editor.

##### *Standards of Objectivity*

Reviews should be conducted objectively. Personal criticism of the author is inappropriate. Referees should express their views clearly with supporting arguments.

##### *Acknowledgement of Sources*

Reviewers should identify relevant published work that has not been cited by the authors. Any statement that an observation, derivation, or argument had been previously reported should be accompanied by the relevant citation. A reviewer should also call to the editor's attention any substantial similarity or overlap between the manuscript under consideration and any other published paper of which they have personal knowledge.

##### *Disclosure and Conflict of Interest*

Privileged information or ideas obtained through peer review must be kept confidential and not used for personal advantage. Reviewers should not consider manuscripts in which they have conflicts of interest resulting from competitive, collaborative, or other relationships or connections with any of the authors, companies, or institutions connected to the papers.

#### Duties of Authors

##### *Reporting standards*

Authors of reports of original research should present an accurate account of the work performed as well as an objective discussion of its significance. Underlying data should be represented accurately in the paper. A paper should contain sufficient detail and references to permit others to replicate the work. Fraudulent or knowingly inaccurate statements constitute unethical behaviour and are unacceptable.

##### *Data Access and Retention*

Authors are asked to provide the raw data in connection with a paper for editorial review, and should be prepared to provide public access to such data (consistent with the ALPSP-STM Statement on Data and Databases), if practicable, and should in any event be prepared to retain such data for a reasonable time after publication.

##### *Originality and Plagiarism*

The authors should ensure that they have written entirely original works, and if the authors have used the work and/or words of others that this has been appropriately cited or quoted.

##### *Multiple, Redundant or Concurrent Publication*

An author should not in general publish manuscripts describing essentially the same research in more than one journal or primary publication. Submitting the same manuscript to more than one journal concurrently constitutes unethical publishing behaviour and is unacceptable.

##### *Acknowledgement of Sources*

Proper acknowledgment of the work of others must always be given. Authors should cite publications that have been influential in determining the nature of the reported work.

##### *Authorship of the Paper*

Authorship should be limited to those who have made a significant contribution to the conception, design, execution, or interpretation of the reported study. All those who have made significant contributions should be listed as co-authors. Where there are others who have participated in certain substantive aspects of the research project, they should be acknowledged or listed as contributors. The corresponding author should ensure that all appropriate co-authors and no inappropriate co-authors are included on the paper, and that all co-authors have seen and approved the final version of the paper and have agreed to its submission for publication.

##### *Hazards and Human or Animal Subjects*

If the work involves chemicals, procedures or equipment that have any unusual hazards inherent in their use, the author must clearly identify these in the manuscript.

##### *Disclosure and Conflicts of Interest*

All authors should disclose in their manuscript any financial or other substantive conflict of interest that might be construed to influence the results or interpretation of their manuscript. All sources of financial support for the project should be disclosed.

#### *Fundamental errors in published works*

When an author discovers a significant error or inaccuracy in his/her own published work, it is the author's obligation to promptly notify the journal editor or publisher and cooperate with the editor to retract or correct the paper.

## Conflict-of-Interest Statement

### Conflicts of Interest

At the point of submission, the *International Journal of Public Health Science (IJPHS)*'s policy requires that each author reveal any financial interests or connections, direct or indirect, or other situations that might raise the question of bias in the work reported or the conclusions, implications, or opinions stated - including pertinent commercial or other sources of funding for the individual author(s) or for the associated department(s) or organization(s), personal relationships, or direct academic competition. When considering whether you should declare a conflicting interest or connection please consider the conflict of interest test: Is there any arrangement that would embarrass you or any of your co-authors if it was to emerge after publication and you had not declared it?

As an integral part of the online submission process, Corresponding authors are required to confirm whether they or their co-authors have any conflicts of interest to declare, and to provide details of these. If the Corresponding author is unable to confirm this information on behalf of all co-authors, the authors in question will then be required to submit a completed Conflict of Interest form to the Editorial Office. It is the Corresponding author's responsibility to ensure that all authors adhere to this policy.

If the manuscript is published, Conflict of Interest information will be communicated in a statement in the published.

## Conflict of Interest in Industry Sponsored Research

Authors whose manuscripts are submitted for publication must declare all relevant sources of funding in support of the preparation of a manuscript. The *International Journal of Public Health Science (IJPHS)* requires full disclosure of financial support as to whether it is from the tobacco industry, the pharmaceutical or any other industry, government agencies, or any other source. This information should be included in the Acknowledgements section of the manuscript. Authors are required to specify sources of funding for the study and to indicate whether or not the text was reviewed by the sponsor prior to submission, i.e., whether the study was written with full investigator access to all relevant data and whether the sponsor exerted editorial influence over the written text. This information should be included in the cover letter.

In addition to disclosure of direct financial support to the authors or their laboratory and prior sponsor-review of the paper, submitting authors are asked to disclose all relevant consultancies within the 12 months prior to submission, since the views expressed in the contribution could be influenced by the opinions they have expressed privately as consultants. This information should be included in the Acknowledgments section of the manuscript.

In the event that a previously undisclosed potential competing interest for an author of a published paper comes to the attention of the editors and is subsequently confirmed with the authors, the undeclared interest will be published as an erratum in a future issue.

## Conflict of Interest Policy: Reviewers and Editors

Reviewers must disclose to editors any conflicts of interest that could bias their opinions of the manuscript, and they should disqualify themselves from reviewing specific manuscripts if they believe it to be appropriate. As in the case of authors, silence on the part of reviewers concerning potential conflicts may mean either that such conflicts exist that they have failed to disclose, or that conflicts do not exist. Reviewers must therefore also be asked to state explicitly whether conflicts do or do not exist. Reviewers must not use knowledge of the work, before its publication, to further their own interests.

Conflict of interest for a given manuscript exists when a participant in the peer review and publication process—author, reviewer, and editor—has ties to activities that could inappropriately influence his or her judgment, regardless of whether judgment is, in fact, affected. Financial relationships with industry (for example, employment, consultancies, stock ownership, honoraria, expert testimony), either directly or through immediate family, are usually considered the most important conflicts of interest. However, conflicts can occur for other reasons, such as personal relationships, academic competition, and intellectual passion. External peer reviewers should disclose to editors any conflicts of interest that could bias their opinions of the manuscript and they should disqualify themselves from reviewing specific manuscripts if they believe it appropriate. The editors must be made aware of reviewers' conflict of interest to interpret the reviews and judge for themselves whether the reviewer should be disqualified" (From the International Committee of Medical Journal Editors *Annals of Internal Medicine* 118, (8) 646-647).  
judge for themselves whether the reviewer should be disqualified." (From the International Committee of Medical Journal Editors *Annals of Internal Medicine* 118, (8) 646-647).

## Specific Policies

Submission by an editor. A paper submitted by an editor will be handled by one of the other editors who does not have a conflict with the review and who is not at the same institution as the submitting editor. The other editor will select referees and make all decisions on the paper.

Submission by author at same institution as one of the editors. A paper submitted by an author for which there is a potential conflict with who is at the same institution as one of the editors will be handled by one of the other editors. The other editor will select referees and make all decisions on the paper.

Submission by family member of editor or by author whose relationship with editor might create the perception of bias. A paper submitted by a family member of one of the editors, or by an author whose relationship with one of the editors might create the perception of bias (e.g. in terms of close friendship or conflict/rivalry), will be handled by another editor. The other editor will select referees and make all decisions on the paper. If in doubt, the editors will consult with the Journal editor.

Potential conflict of interest for reviewers. The invitation letter to reviewers will include the following paragraph: 'If you know or think you know the identity of the author, and if you feel there is any potential conflict of interest in your refereeing this paper because of your relationship with the author (e.g. in terms of close friendship or conflict/rivalry) or for any other reason, please declare it. By accepting this invitation, it is assumed there is no potential conflict of interest.' Standard policy will be not to use a referee if a conflict of interest has been declared, but the editors may use their discretion after consulting with one another.

## Informed Consent, Privacy and Confidentiality Statement

This document is adapted from the Uniform Requirements for Manuscripts Submitted to Journals: Ethical Considerations in the Conduct and Reporting of Research: Privacy and Confidentiality, and Protection of Human Subjects and Animals in Research as published by the International Committee of Medical Journal Editors. Compliance with the entire Uniform Requirements for Manuscripts as published by the ICMJE is mandatory for all manuscripts submitted for consideration to the Journal of Surgical Radiology. Please review the information below carefully.

**Patients and Study Participants:** Patients have a right to privacy that should not be violated without informed consent. Identifying information, including names, initials, or hospital numbers, should not be published in written descriptions, photographs, or pedigrees unless the information is essential for scientific purposes and the patient (or parent or guardian) gives written informed consent for publication. Informed consent for this purpose requires that an identifiable patient be shown the manuscript to be published. Authors should disclose to these patients whether any potential identifiable material might be available via the Internet as well as in print after publication. Patient consent should be written and archived with the journal, the authors, or both, as dictated by local regulations or laws. The Journal of Surgical Radiology requires that all authors obtain written patient consent and that this be archived by the author and available for inspection for a period of at least three years. A written statement should be included in the

manuscript that attests that the authors have obtained and archived written patient consent. Nonessential identifying details should be omitted. Informed consent should be obtained if there is any doubt that anonymity can be maintained. For example, masking the eye region in photographs of patients is inadequate protection of anonymity. If identifying characteristics are altered to protect anonymity, such as in genetic pedigrees, authors should provide assurance, and editors should so note, that such alterations do not distort scientific meaning.

Manuscripts that include human subjects must include a statement that written informed consent was obtained. If materials or records derived from humans are included, the statement that approval from an Institutional Review Board (IRB) or Ethics Committee was obtained prior to initiation of the study, if it is required by the institution. When reporting experiments on human subjects, authors should indicate whether the procedures followed were in accordance with the ethical standards of the responsible committee on human experimentation (institutional and national) and with the Helsinki Declaration of 1975, as revised in 2008. If doubt exists whether the research was conducted in accordance with the Helsinki Declaration, the authors must explain the rationale for their approach and demonstrate that the institutional review body explicitly approved the doubtful aspects of the study. When reporting experiments on animals, authors should indicate whether the institutional and national guide for the care and use of laboratory animals was followed.

The use of laboratory animals must follow the standards established by the NIH Office of Animal Care and Use (OACU ARAC guidelines) and Institute for Laboratory Animal Research as published in the Guide for the Care and Use of Laboratory Animals (1996).

**Authors and Reviewers:** Manuscripts will be reviewed with due respect for authors' and reviewers' confidentiality. Our editors have been instructed to not disclose information about manuscripts (including their receipt, content, status in the reviewing process, criticism by reviewers, or ultimate fate) to anyone other than the authors and reviewers. Manuscripts sent for review are privileged communications. Therefore, reviewers and members of the editorial staff must respect the authors' rights by not publicly discussing the authors' work or appropriating their ideas before the manuscript is published. Reviewers may not make copies of the manuscript for their files and will not share it with others, except with the editor's permission. Reviewers should return or destroy copies of manuscripts after submitting reviews.

## Recommendations for the Conduct, Reporting, Editing, and Publication

The IJPHS comply with the [International Committee of Medical Journal Editors' uniform requirements for manuscripts](#) below.

## Checklist for preparing your paper for publication

You can use this list to carry out a final check of your submission before you send it to the journal for review. Please check the relevant section in this [Guide for Authors](#) for more details.

1. Is your manuscript written in [IJPHS format](#)? At this stage, it is not that essential that you follow every detail of [IJPHS format](#). Please try to follow the format as closely as possible.
2. Is your title adequate and is your abstract correctly written? The title of paper is max 12 words, without Acronym or abbreviation. The Abstract (MAX 200 WORDS) should be informative and completely **self-explanatory (no citation in abstract)**, provide a clear statement of the **problem**, the **proposed** approach or solution, and point out **major findings** and conclusions.
3. Authors are suggested to present their articles in the sections structure: **Introduction - The Proposed Method/Procedure specifically designed (optional) - Research Method - Results and Discussion - Conclusion**. Authors may present complex proofs of theorems or non-obvious proofs of correctness of

- algorithms after introduction section (obvious theorems & straightforward proofs of existing theorems are NOT needed).
4. Introduction section: explain the context of the study and state the precise objective. An Introduction should contain the following three parts:
    - Background: Authors have to make clear what the context is. Ideally, authors should give an idea of the state-of-the-art of the field the report is about.
    - The Problem: If there was no problem, there would be no reason for writing a manuscript, and definitely no reason for reading it. So, please tell readers why they should proceed reading. Experience shows that for this part a few lines are often sufficient.
    - The Proposed Solution: Now and only now! - authors may outline the contribution of the manuscript. Here authors have to make sure readers point out what are the novel aspects of authors work.
 Authors should place the paper in proper context by citing relevant papers. At least, 10 references (recently journal articles) are referred in this section to show lack of previous research studies, and the uniqueness or novelty of the research on the topic.
  5. Method section: the presentation of the experimental methods should be clear and complete in every detail facilitating reproducibility by other scientists.
  6. Results and discussion section: The presentation of results should be simple and straightforward in style. This section report the most important findings, including results of statistical analyses as appropriate and comparisons to other research results. Results given in figures should not be repeated in tables. This is where the author(s) should explain in words what he/she/they discovered in the research. It should be clearly laid out and in a logical sequence. This section should be supported suitable references.
  7. Conclusion section: Summarize sentences the primary outcomes of the study in a paragraph. Are the claims in this section supported by the results, do they seem reasonable? Have the authors indicated how the results relate to expectations and to earlier research? Does the article support or contradict previous theories? Does the conclusion explain how the research has moved the body of scientific knowledge forward?
  8. **Language.** If an article is poorly written due to grammatical errors, while it may make it more difficult to understand the science.
  9. Please be sure that the manuscript is up to date. **It is expected that 20 to 30% of references are to recent papers.**
  10. Is the manuscript clearly written? Is the article exciting? Does the content flow well from one section to another? Please try to keep your manuscript on the proper level. It should be easy to understand by well qualified professionals, but at the same time please avoid describing well known facts (use proper references instead). Often manuscripts receive negative reviews because reviewers are not able to understand the manuscript and this is authors' (not reviewers') fault. Notice, that if reviewers have difficulties, then other readers will face the same problem and there is no reason to publish the manuscript.
  11. Do you have enough references? We will usually expect a minimum of 25 to 30 references primarily to journal papers, depending on the length of the paper. Citations of textbooks should be used very rarely and citations to web pages should be avoided. All cited papers should be referenced within the text of the manuscript.
  12. Figures and Tables. Relation of Tables or Figures and Text: Because tables and figures supplement the text, all tables and figures should be referenced in the text. Avoid placing figures and tables before their first mention in the text. Authors also must explain what the reader should look for when using the table or figure. Focus only on the important point the reader should draw from them, and leave the details for the reader to examine on her own.
 

**Figures:**

    - a. All figures appearing in article must be numbered in the order that they appear in the text.
    - b. Each figure must have a caption fully explaining the content
    - c. Figure captions are presented as a paragraph starting with the figure number i.e. Figure 1, Figure 2, etc.
    - d. Figure captions appear below the figure
    - e. Each figure must be fully cited if taken from another article
    - f. all figures must be referred to in the body of the article

**Tables:**

    - a. Material that is tabular in nature must appear in a numbered captioned table.
    - b. All tables appearing in article must be numbered in the order that they appear in the text.
    - c. Each table must have a caption fully explaining the content with the table number i.e. Table 1, Table 2, etc.
    - d. Each column must have a clear and concise heading
    - e. Tables are to be presented with single horizontal line under: the table caption, the column headings and at the end of the table.
    - f. All tables must be referred to in the body of the article
    - g. Each table must be fully cited if taken from another article
  13. Each citation should be written in the order of appearance in the text in square brackets. For example, the first citation [1], the second citation [2], and the third and fourth citations [3,4]. When citing multiple sources at once, the preferred method is to list each number separately, in its own brackets, using a comma or dash between numbers, as such: [1], [3], [5] or [4-8]. It is not necessary to mention an author's name, pages used, or date of publication in the in-text citation. Instead, refer to the source with a number in a square bracket, e.g. [9], that will then correspond to the full citation in your reference list. Examples of in-text citations:
    - o This theory was first put forward in 1970 [9]."
    - o Sutikno [10] has argued that...
    - o Several recent studies [7], [9], [11-15] have suggested that....
    - o ...end of the line for my research [16].
  14. Please be aware that for the final submission of regular paper you will be asked to tailor your paper so the last page is not half empty.

### ABSTRACT

The spread and pandemic of coronavirus disease (COVID-19) that is currently happening in the world, has led to new policy steps in the security of public spaces to reduce the transmission of COVID-19 and protect public health. There is new adaptation in the policies while using space like limiting the use of public spaces, increasing social distancing between people or creating territory. Territory means specific area where are claimed or maintained (can be physically, through ruler or symbols). Territory can give a sense of security to the users. Therefore, this paper give insight and rethinking the territory concept as sense of security in interior public space and built environment where people expect to see strangers in this space. The methods in this paper are literature review method by collecting and synthesizing previous research using integrative approach. For the result is territory concept achieved as part of protection to the users in the build environment with mechanisms that should be applied in each type: the boundary between areas; limitation to the symbolic; supervision and control of space.

## 1. INTRODUCTION

COVID-19 or Corona (CO) Virus (VI) Disease (D), is a disease that was found in 2019 with the name: 2019 novel coronavirus or 2019-nCoV. This virus is similar with Severe Acute Respiratory Syndrome (SARS) and other flu virus. The contagion of COVID-19 is from human contact, air transmission (especially in the indoor) and contaminated objects (like money, phone, interior furniture surface) [1]. World Health Organization has declared COVID-19 as a pandemic on 12th March 2020 because the spread of COVID-19 has become worldwide. In the effort to control the COVID-19 outbreak and reducing the widespread of COVID-19 in Indonesia, the government has adopted few policies such large scale social restrictions (LSSR), Work and School from Home, restrict activities in public places-space facilities and the implementation of clean-healthy living behavior [2]–[4]. The immediate dan precaution policies by Indonesia government have made economic and social disruption and crisis on public health, food system, and world of work and school. Therefore, the government made a new strategy that focusing in the new normal protocol and personal protection as step to anticipate the widespread of COVID-19 in the public space and built environment [5].

The new normal protocols such as controlling the users flow inside the public space and built environment, protocols and protection for the officers and employees of the public space, and protocols

activities in the public space and built environment. The personal protection including the intensive and extensive cleaning, disinfectant and sanitizing the facility, social-physical distancing system and temperature and health check [5]. To face a pandemic like this, public space and built environment need to adapt the new normal protocols. Architecture and interior designers are expected to provide design solutions that enhance safety and security and help prevent the health threats like COVID-19 in the future [6], [7]. These new adaptations in the public space and built environment are changing our way of using the space by limiting the activity and use of the public space and built environment, increasing physical-social distancing between people, and creating territory.

Delaney in de Yong [8], [9] described territory as providing security to those inside from those ever present dangers located outside. While Rapoport and Pearson in de Yong [9], [10] defined territory as area where are claimed or maintained through ruler-symbol and physical attribute. Before COVID-19, the territory concept applied in the public space is such no boundary or surveillance and less defensible space. But after COVID-19 and the new normal protocol, there is changing, and new practice emerge in the practice territory. This paper aims to give insight and rethinking the territory concept as sense of security in the public space and built environment where people expect to see strangers in this space.

## 2. RESEARCH METHOD

The research methods in this paper are literature review and site observation method. The literature review approach for this paper will be the integrative or critical review approach through computer search, with the purpose of this review is to assess critique and synthesize the literature on a research topic in a way that enables new theoretical frameworks and perspectives to emerge. There will be 4 phase of literature review: design (phase 1), conduct (phase 2), analysis (phase 3) and structuring and writing the review (phase 4) [11]. The framework from the literature review data will be used as guidelines and tools to analyze the site using observation method to create a conclusion of rethinking territory after COVID-19.

### 2.1. The literature review method

The primary databases that will be used in this literature review method will be utilized to retrieve territory for public space and built environment literature presented in this review were ProQuest, ScienceDirect, Lens.org and Google Scholar. The keywords for search terms, used both separately and in combination, included: "territory," "territoriality," "territorialization," "COVID-19," "coronavirus," "SARS-CoV-2," "public space," "built environment," "architecture," "security," and "interior." Only articles with qualitative method and presented in Indonesia and English language were included. There are 52 documents reviewed. There are four phases for this literature review method with integrative review approach [11].

- a). Phase 1: designing the review. In this phase is about deciding the purpose, specific research question and type of approach. The explanation in this phase will answer regarding the aim, the importance and why this review should be conducted and its contribution. There are 52 articles reviewed.
- b). Phase 2: conducting the review; in this phase, is about testing the search terms and inclusion criteria on a smaller sample with the focus on the definition and types and concept of territory. In this phase, only 30 articles were included in this journal.
- c). Phase 3: analysis; in this phase is about how articles will be used to conduct an appropriate analysis. The data abstracted from descriptive information such of topic or from the effect and findings.
- d). Phase 4: writing the review; in this phase is creating descriptive summaries of research regarding the number of articles published, topics covered, citations analyzed, authors represented, method used. The data collecting in this review will be a combine perspectives and insights from different field. The three field will be collected as literature data. The literature data will be analyzed and examined based on the ideas and relationships within the issue to create a new conceptual framework.

### 2.2. The site observation method

The site observation is the next method that will be used in this paper. The purpose of this method is to create new conceptual framework based on the issue territory concept after COVID-19. This method involves observing people in their natural activities and usual context such as public space and built environments [12], [13]. With direct observation the researcher is present and indirect observation the activities may be recorded using photo digital recording. The steps for this site observation will be: i) define objectives and context of the observation; ii) define the method of observation (using taking notes and direct observation) and the method of recording information (using digital photo and video recording) in the public space (shopping mall and church). The data was collected between March 2020-June 2020; iii) hypothesize and explanation for the phenomenon; iv) analyze the data gathered and create a list of insights derived from observation to create discussion and a new conceptual framework as the result of rethinking the territoriality concept on public space.

### 3. RESULTS AND DISCUSSION

The aim for literature review of territoriality concept is to create a framework regarding the territoriality concept before COVID-19 (phase 1). The literature review started by describing the territoriality concept before COVID-19 from the introduction and background, definition, function, type, and mechanism from various studies and the topic regarding the public space and built environment (phase 2). The data will be analyzed using descriptive method (phase 3). Then the result is written in a conceptual framework (phase 4). Research report on the COVID-19, territoriality and build environment is shown in Table 1 (see in Appendix).

#### 3.1. Literature review analysis of territoriality concept

Based on Pastalan in Lang [14], The concept territoriality is associated with the territory of human in this case is user of space. The territory defined as a restricted space where a person or group of people uses and maintains it as an exclusive space and involves identification, psychological environmental place, symbolizing it with possessive conduct and organizing objects in the area. While J. Douglas Porteous (1976) in Zubaidi and de Yong [9], [15] defined the concept of territoriality as a spatial behavior that involves special control of space by individuals or groups of users that are intraspecific in nature involving animosity and giving the individual or group of users the policy to use and defend the space. Altman in Lang [14] defined territorial behavior as a mechanism of self-limiting and self-regulating behavior that involves personalizing or claiming a place or object and communicating that the place is already owned by a person or group of user. Delaney in de Yong [8], [9] describe territory as providing security to those inside from those ever present dangers located outside. While Rapoport in de Yong [9], [10] defined territory as area where are claimed or maintained through ruler-symbol and physical attribute. As the result of this literature review describe that the concept of territoriality is associated with the activity of users and spatial behavior of users while defending space using symbols, identity, and personalization in the space itself. For the conclusion of the territoriality concept, please refer to Figure 1. Based on this, the characteristic of territoriality concept is: (i) marking in the area and creating boundary; (ii) personalization on the area; (iii) Truth to defend the area; (iv) Fulfilment in the basic physiological, cognitive, and aesthetic needs. Territoriality has a function to fulfil the human psychological and social needs, which is as mechanism to sustain life (by controlling the space), provide a sense of security and identity, creating personal integrity and creating invisible frame for the user while socializing in the environment. There are two mechanism in the territorial concept, which is the defense mechanism and personalization mechanism [14], [16]. In conclusion, territoriality is associated with the activity and spatial behavior of someone in defending its territory.

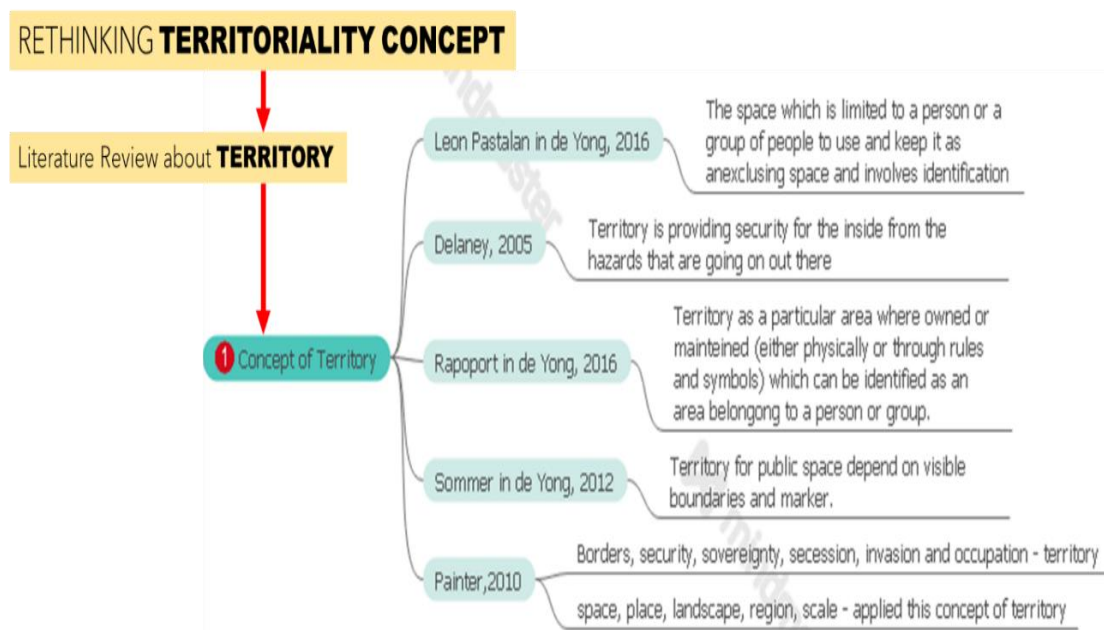

Figure 1. Conclusion for the concept of territoriality

Sommer [17] defined that there are three types of territoriality: personal space, home base (defensible active space), and home range (behavior setting from the activity). Hussein El-Sharkawy in Lang [14] defined four types of territoriality: attached (space bubble), central (personalization space), supporting (semipublic but can be owned by organization) and peripheral (public space). Altman in Hadinugroho [18], [19] define three types of territoriality: primary (owned and personalized by the owner), secondary (cannot be owned but still can be personalized) and public (used by a lot of users). When we are doing personalization in a space especially personal space, there are few factors as reference in using the personal space: status, gender, physic, age, personality, culture, environment condition [20]. The control mechanism in territory is: primary (real boundary, symbolic boundary, clear area boundary, control and clear surveillance, more defensible, more personalization), secondary primary (not really real boundary, could have symbolic boundary, grey area boundary, could have control and partly clear surveillance, defensible, personalization) and public primary (no real boundary, no symbolic boundary, no clear area boundary, no control and clear surveillance, less defensible, no personalization) [16]. The conclusion of the territoriality concept can be seen in Figure 1 and 2.

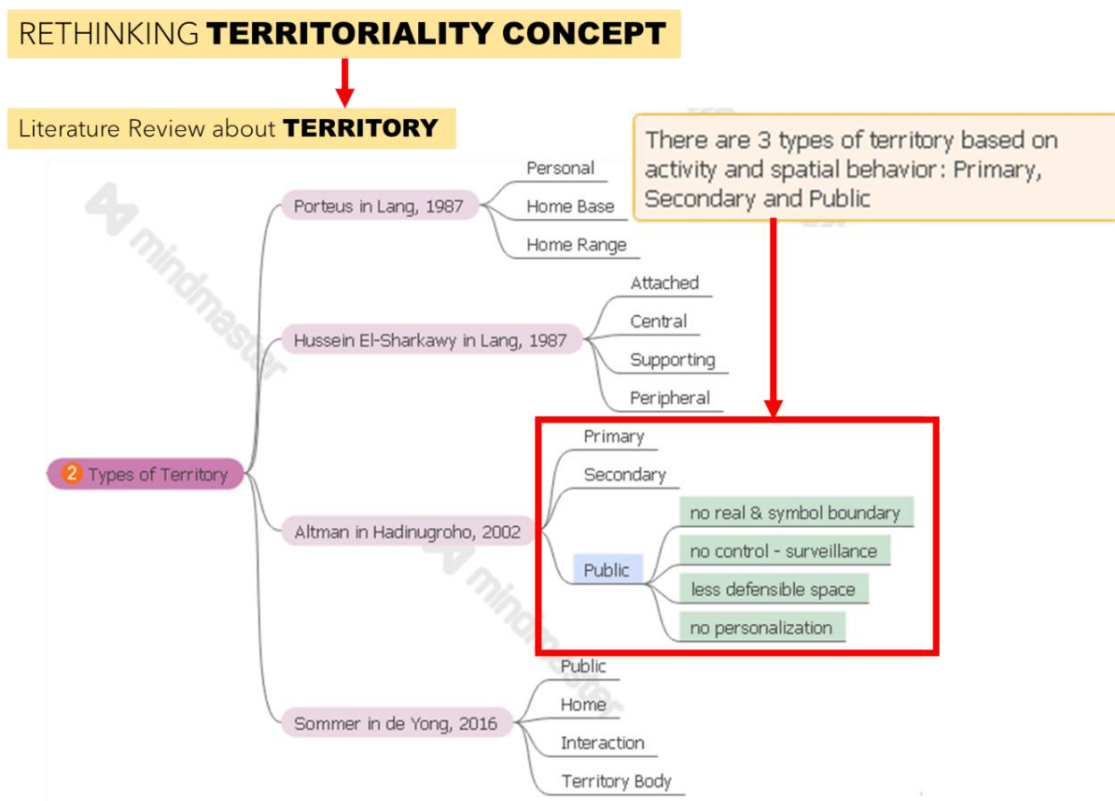

Figure 2. Conclusion for the mechanism of territoriality

### 3.2. Literature review analysis of COVID-19 and built environment

COVID-19 stands for Corona (CO) Virus (VI) Disease (D) is a new virus that is associated with the same virus family as Severe Acute Respiratory Syndrome (SARS) and several other types of flu. Symptoms when exposed to this disease are fever, cough and shortness of breath. In more severe cases, the infection can cause pneumonia or difficulty breathing, and even be fatal. These symptoms are similar to those of the flu (influenza) or the common cold, so testing is needed to confirm whether a person has COVID-19. [21] The virus is transmitted by direct contact with respiratory droplets from an infected person (generated through coughing and sneezing). Individuals can also become infected after touching a contaminated surface and then touching their face (eg, eyes, nose, and mouth). The COVID-19 virus can survive on surfaces for several hours but can be killed with a simple disinfectant. Apart from respiratory droplets, this virus can also spread through aerosols with smaller particles (especially in indoor spaces) and stay in the air for several hours. The virus is more susceptible and affects older people, or people with pre-existing medical conditions, such as diabetes and heart disease [21].

Therefore, there are several rules that can be applied through the spatial layout to help reduce the spread of this virus through the new spatial layout. For example, in the work environment: avoiding eating out, two meters of social distancing, use of transparent screens around the table, innovative hands-free door handles, opening windows to increase air circulation, cleaning regularly and thoroughly, implementing flexible working hours, and meetings with large distances as in the following example. The COVID-19 pandemic has changed user behavior when indoors. Architects and future users will pay more attention to climate, health, architecture, and environmental issues and how these four affect one another. The design of future structures will certainly consider sustainability, health and flexibility more so that future structures can be useful to prevent the spread of viruses like this again [7]. In conclusion, COVID-19 has brought impact in the public space and built environment so there will be changing in the public space and built environment in the future.

### 3.3. Site observation of territoriality concept in public space (shopping mall and church)

The Objective for the site observation method is to observe and creating a list of insight regarding the changing in the built environment after COVID-19. The public space sample that is use in this paper is a shopping mall and a church in Surabaya-Indonesia. The data was collected between March 2020 through June 2020. The more detailed pictures of the changing of the shopping mall and church are shown in Figure 3 (see in Appendix).

Based on the above site observation, then there are changing in the public space-built environment (in this study case is shopping mall and church). The changing in the control mechanism of territoriality, especially in the Public Primary. Before COVID-19, the mechanism of territoriality is no real boundary, no symbolic boundary, no clear area boundary, no control, and clear surveillance, less defensible, no personalization). But after COVID-19, there are real, symbolic, and clear area boundary; controlling and clear surveillance; and more defensible space. The changing especially applied in the outside perimeter, through the inside public space and signage for reminding the user to keep physical-social distancing and using mask all the time.

## 4. CONCLUSION

Based on the literature review of territoriality space and COVID-19 and built environment, and site observation, it is clearly show that there are changing in the concept of territoriality for public space. Before COVID-19, the territory concept applied in the public space is such no boundary or surveillance and less defensible space. But after COVID-19 and the new normal protocol, there is changing, and new practice emerge in the practice territory.

Even though there are still limitation in this study (not much study for this issues), we still can see in the site observation's pictures that there are some changing in the public space of shopping mall and church. In conclusion, we expect to see strangers and should have the freedom while using the public space, but the new normal mechanism for territoriality concept (real, symbolic, and clear area boundary; controlling and clear surveillance; and more defensible space) is changing the user while using the space. We still need more study in future research regarding this matter. The spread of the future disease, the human detachment, culture, behavior, virtual world, and even local climate can implicate the future territoriality concept. We still need to develop more evidence using different method to creating new normal framework and new position emerge for territoriality concept.

## ACKNOWLEDGEMENTS

## APPENDIX

Table 1. Research report on the COVID-19, territoriality and build environment

Author and Explanation	COVID-19 & Built environment			Territoriality		Public built environment	
	Past	Present	Future	Definition	Type	Physical	Non Physical
Creating Architecture Theory [14] This book is discussing about the definition and type of territoriality				■	■		
Retrterritorializing Chinise Living Space Apartments in Singapore [9] This Artile is discussing possibility of changing the territory based on culture house layout and new apartment layout.				■		■	■
Territoriality concept for crime prevention in Interior Design [16] This article is discussing the concept of territoriality as part of crime prevention in the interior design				■	■	■	
Territory: A Short Introduction [8] This article is about the definition of territoriality and its meaning in the architecture design				■			
Space and Behaviour: a research on Architecture ( <i>Ruang dan Perilaku: Suatu Kajian Arsitektural</i> ) [19] This book is discussing the definition and type of territoriality in architecture based on several reference.				■	■		
Types and pattern of Territory in the Traditional Settlement of Ngata Toro [15] This article is about defining territory theory regarding types and patterns of territories in a traditional settlement in Ngata Toro.					■		■
Territory in the Traditional Settlement Context [22] This article is about defining territory theory regarding types and patterns of territories in a traditional settlement context.					■		■
Rethinking Territory [23] This article is about the phenomenon of territory as foundation to state power abd ket akibe tge exoressuib if a biological imperative.					■		■
The impact of COVID-19 on public space: a review of the emerging questions [24] This article is about insight and possibility in changing on public space after COVID-19.		■	■			■	
<i>Public space or safe space – remarks during the COVID- -19 pandemic</i> [25] This article is about phenomena and behavior changing while using public space and its correlation for the future.		■	■			■	
Antivirus-built environment: Lessons learned from Covid-19 pandemic [26] This article is a review regarding the history of epidemic in the development and the cities and the possibility design solution for the future cities.	■	■	■			■	
Using social and behavioural science to support COVID-19 pandemic response [27] This article is about impact of COVID-19 in the future and health crisis in the society.		■	■				■
How COVID-19 redefines the concept of sustainability[28] This article is discussing about how the effect of COVID-19 in the global sustainability.		■	■				
COVID-19 and spatial planning [29] This article is explaining about the necessity of creative in the spatial planning after COVID-19.		■				■	
COVID-19 pandemic: Prevention and protection measures to be adopted at the workplace [30] This article aimed to make a health protocol to prevent the spread of COVID-19.		■				■	
Future of Sustainable Architecture: Rethinking COVID-19 a Pandemic or turning point? [7] This article is discussing the architecture sustainability in the future cities and urban.		■	■			■	
Rethinking public space: between rhetoric and reality [31] This article is an evaluation about public perception in term of social and economy issue.						■	■
The resilient city and adapting to the health emergency [32] This article is explaining about the concept of resilient city in the future.		■	■			■	

Author and Explanation	COVID-19 & Built environment			Territoriality		Public built environment	
	Past	Present	Future	Definition	Type	Physical	Non Physical
The Coronavirus crisis: What will the post-pandemic city look like?.[33] This article is predicting the possibility of urban sprawl to the small cities.			■			■	
Shifting Interiority: Changing Encounters With Our Environment [34] This article is explaining the adaptation in the interior after pandemic.		■	■			■	

#### Outside perimeter of Shopping Mall

This picture is showing the new-normal protocol outside the building that demanding the user is lining up to wash their hand and there is temperature check in the front door before entering the Shopping Mall. This is showing that there are control and surveillance before entering the Shopping Mall

#### Public Space Area of Shopping Mall

These pictures are showing that user need to walk based on the instruction and symbols on the floor. There are also symbol that limit the user to use the bench. This is showing that there are more defensible space and more symbol boundary while using the space.

#### Detail Sign for Social and Physical Distancing of Shopping Mall

These pictures are showing symbol and signage to remind the user to keep social and physical distancing all the time. This signage is become a guideline for people while using the space. This is showing that there are control and symbol boundary in the Shopping Mall

Figure 3. Site Observation compilation pictures on Shopping Mall and Church
