Target Recognition And Tracking

Facial Expression Recognition Using LBP and CNN Networks Integrating Attention Mechanism	1
<i>Chengxu Liang (Tianjin University of Technology and Education, China), Jianshe Dong (Tianjin University of Technology and Education, China), Jinliang Li (Tianjin University of Technology and Education, China), Jia Meng (Tianjin University of Technology and Education, China), Yuchen Liu (Tianjin University of Technology and Education, China), and Tinghong Fang (Tianjin University of Technology and Education, China)</i>	
Object Tracking with Restrain Learning Anomaly and Adaptive Feature Fusion	7
<i>Wanjun Liu (Liaoning Technical University, China), Linlin Liang (Liaoning Technical University, China), and Haicheng Qu (Liaoning Technical University, China)</i>	
Emotion recognition based on CNN-SVM from EEG signals	15
<i>Yuyu Jia (Tianjin University of Technology and Education, China), Chunxiao Han (Tianjin University of Technology and Education, China), Wenhui Tong (Tianjin University of Technology and Education, China), and Yue Pei (Tianjin University of Technology and Education, China)</i>	

Intelligent Image Detection Technology and Application

Automotive Gear Defect Detection Method Based on Yolov8 Algorithm	19
<i>HaiTeng Wang (Tianjin University of Technology and Education, China), Genghuang Yang (Tianjin University of Technology and Education, China), Xiayi Hao (Tianjin University of Technology and Education, China), and Liqing Geng (Tianjin University of Technology and Education, China)</i>	
Probability-Corrected Overlapping Community Detection Algorithm Based on GCN	24
<i>Pengcheng Zhao (Tianjin University of Technology and Education, China), Xiaoyan Zheng (Tianjin University of Technology and Education, China), and Chen Liu (Tianjin University of Technology and Education, China)</i>	

Detecting Soil Moisture Content Based on Multispectral Images from Unmanned Aerial Vehicle.....	32
Hao Jinyu (<i>Shandong Agricultural University Tai'an, China</i>), Jiang Tianyou (<i>Shandong Agricultural University Tai'an, China</i>), He Shutian (<i>Shandong Agricultural University Tai'an, China</i>), Liu Ximeng (<i>Shandong Agricultural University Tai'an, China</i>), Hu Jiming (<i>Shandong Agricultural University Tai'an, China</i>), and Sun Xiaoyong (<i>Shandong Agricultural University Tai'an, China</i>)	

Signal Acquisition, Detection and Analysis

Characteristics Analysis and Classification of Foot Autonomic Movements Based on EEG Signals	43
Lin He (<i>Tianjin University Of Technology And Education, China</i>), Tongning Meng (<i>Tianjin University Of Technology And Education, China</i>), Zhikun Zhuan (<i>Tianjin University Of Technology And Education, China</i>), Yan Bian (<i>Tianjin University Of Technology And Education, China</i>), Zhiwen Zhang (<i>Tianjin University Of Technology And Education, China</i>), and Junjie Li (<i>Tianjin University Of Technology And Education, China</i>)	
Features Extraction of Different Emotional Based on Brain Rhythm	50
Yanli Liu (<i>Tianjin University of Technology and Education, China</i>), Chunxiao Han (<i>Tianjin University of Technology and Education, China</i>), Wenhui Tong (<i>Tianjin University of Technology and Education, China</i>), Junxiu Liu (<i>Tianjin University of Technology and Education, China</i>), Yingmei Qin (<i>Tianjin University of Technology and Education, China</i>), and Yanqiu Che (<i>Tianjin University of Technology and Education, China</i>)	
Research on Hybrid Online Brain-Computer Interface System Based on MI-mVEP	56
Zhikun Zhuan (<i>Tianjin University Of Technology And Education, China</i>), Yan Bian (<i>Tianjin University Of Technology And Education, China</i>), Xinglin He (<i>Tianjin University Of Technology And Education, China</i>), Peng Yuan (<i>Tianjin University Of Technology And Education, China</i>), Liqing Geng (<i>Tianjin University Of Technology And Education, China</i>), Junjie Li (<i>Tianjin University Of Technology And Education, China</i>), and Miao Sun (<i>Tianjin University Of Technology And Education, China</i>)	
Automatic Schizophrenia Detection from Scalp EEG Using CNN with Wide Convolutional Kernel and ELM	62
Chun Wei (<i>Tianjin University of Technology and Education, China</i>), Yingmei Qin (<i>Tianjin University of Technology and Education, China</i>), Jing Liu (<i>Tianjin University of Technology and Education, China</i>), Lijie Jiang (<i>Tianjin University of Technology and Education, China</i>), and Yanqiu Che (<i>Tianjin University of Technology and Education, China</i>)	
Detection of Epileptic EEG Signals Based on an Improved AFSA-GA Algorithm	67
Qiguang He (<i>Tianjin University of Technology and Education, China</i>), Ruofan Wang (<i>Tianjin University of Technology and Education, China</i>), and Shusheng Zhou (<i>Tianjin University of Technology and Education, China</i>)	

Image Analysis and Processing

Secure Reversible Data Hiding in Images with Scalable Capacity	74
<i>Boyang Li (North University of China, China)</i>	
Compressed Sensing Algorithms Applied to Ill-Posed CT Image Reconstructions	79
<i>Jian Dong (Tianjin University of Technology and Education, China) and Yanze Zheng (Tianjin University of Technology and Education, China)</i>	
CoomFL:Improving Global and Local Model Coordination Strategies for Heterogeneous Medical Image Tasks in Federated Learning	87
<i>Yahan Mu (Northeast Forestry University, China) and Peng Liu (Northeast Forestry University, China)</i>	
Research on Algorithm for Small Object Head Pose Estimation	97
<i>Lianning Wang (Beijing Institute of Technology, China), Yajun Yao (Beijing Institute of Technology, China), and Chongwen Wang (Beijing Institute of Technology, China)</i>	
A Deep Learning Model for Multiclass Image Classification Using Quantum CNN	102
<i>Roopa Golchha (National Institute of Technology Raipur, India) and Gyanendra K. Verma (National Institute of Technology Raipur, India)</i>	

Multimedia Technology and Visualization

Exhibition Design of Marine Culture Theme Exhibition Hall Under Interactive Experience	108
<i>Jingwen Yuan (Pukyong National University, Korea), Longlong Zhang (Pukyong National University, Korea), and Chul Soo Kim (Pukyong National University, Korea)</i>	
Custom AI Streaming Accelerator Architecture	114
<i>Xin Yu Niu (Corerain Technologies Co. Ltd., China), Chao Xiong (Corerain Technologies Co. Ltd., China), Li Jiao (Corerain Technologies Co. Ltd., China), and Kuen Hung Tsui (Corerain Technologies Co. Ltd., China)</i>	
Verification and Accuracy Check of Luminance and Illuminance Measurements Using a Commercial IP Camera Applied as an HDR Vision Sensor	123
<i>Aris Budhiyanto (National Taiwan University of Science and Technology, Taiwan) and Yun-Shang Chiou (National Taiwan University of Science and Technology, Taiwan)</i>	
Rate Control Method for Video Encoders Operating in Industrial Environments	128
<i>Jose Rosa (Instituto de Telecomunicações; Politécnico de Leiria, Portugal), Ruben Antonio (Instituto de Telecomunicações; Politécnico de Leiria, Portugal), Lino Ferreira (Instituto de Telecomunicações; Politécnico de Leiria, Portugal), Monica Figueiredo (Instituto de Telecomunicações; Politécnico de Leiria, Portugal), Pedro Assuncao (Instituto de Telecomunicações; Politécnico de Leiria, Portugal), and Carlos Ribeiro (Politécnico de Leiria; Twevo, Lda., Portugal)</i>	

Data Calculation and Information Management

3D Trajectory Planning of Manipulator Based on Ant Colony Algorithm	132
<i>Fei Hao (Tianjin University of Technology and Education, China), Xinqi Li (Tianjin University of Technology and Education, China), and Lanting Shi (Tianjin University of Technology and Education, China)</i>	
Vehicle Flow Prediction at Checkpoint Considering Trajectory Based on Convolutional Long Short-Term Memory Network1	136
<i>Jing Chen (Tianjin University of Technology and Education, China), ZhaoChong Zhang (Tianjin University of Technology and Education, China), GuoWei Yang (Tianjin University of Technology and Education, China), Wei Wang (Tianjin University of Technology and Education, China), JiaJia Zhang (Tianjin University of Technology and Education, China), and ChunHui Wu (Tianjin University of Technology and Education, China)</i>	
Shared Bike Demand Prediction Based on Multi-Scale ABiLSTM	141
<i>GuoWei Yang (Tianjin University of Technology and Education, China), Jing Chen (Tianjin University of Technology and Education, China), ZhaoChong Zhang (Tianjin University of Technology and Education, China), and Wei Wang (Tianjin University of Technology and Education, China)</i>	
Review of Technologies of Intelligent Development of Airport Complex Operation System	147
<i>Ruiqing Zhang (The 2Nd Research Institute Of Civil Aviation Administration Of China, China), Donglin He (The 2Nd Research Institute Of Civil Aviation Administration Of China, China), Shixuan Zhao (The 2Nd Research Institute Of Civil Aviation Administration Of China, China), Yi Qiao (The 2Nd Research Institute Of Civil Aviation Administration Of China, China), and Yunfeng Sui (The 2Nd Research Institute Of Civil Aviation Administration Of China, China)</i>	
Privacy-Preserving Task Offloading in Vehicular Edge Computing	156
<i>Bin Cao (HeBei University of Technology, China), Ziming Li (HeBei University of Technology, China), Xin Liu (HeBei University of Technology, China), and Zhihan Lv (Uppsala University, Sweden)</i>

24 Juli 2023 pukul 14.58

Hi,

Warm greeting from ICBSTS 2023.

The accepted articles of ICBSTS 2023 is included in ICAMC 2023. Due to the change of the publication of ICAMC articles, it was changed to Materials Science Forum (MSF). This journal has stricter regulations on the subject and only accepts articles related to materials. Therefore, although there is no problem with the quality of your article, this journal cannot accept your article because of the subject matter. I have submitted your article to the committee for publication, and the committee recommends your article be published together with the **2023 5th Asia Symposium on Image Processing (ASIP 2023)** (<http://www.asip.net/>) journal (**ASIP 2023 CPS Conference Proceedings**) which will be submitted to **IEEE Xplore**, and submitted to be indexed by **Ei Compendex and Scopus..** You don't need to attend the meeting and give an oral presentation again, nor do you need to register and charge. So I wonder if you can accept it? Please send the email back to me before **July 26, 2023**. So that I can proceed to the next step. Thanks for your kind understanding.

Best regards,

Ms. Jane Li

Conference Secretary of ICBSTS 2023

 Kepada: conference secretary <conf_secretary@yeah.net>

24 Juli 2023 pukul 19.05

Dear Ms. Jane Li,

I have no problem if it is published in the ASIP 2023 conference proceedings.

May I ask, so the paper will be published under ASIP 2023 conference instead of ICBST 2023, or still under ICBST 2023 conference?

Thank you.

Best regards,
 Aris

 Kepada: aris budhiyanto <aris.budhiyanto@gmail.com>

25 Juli 2023 pukul 09.39

Dear Aris,

Thanks for your kind feedback.

The paper will be published under ASIP 2023 conference. Thanks for your understanding.

Dear Aris,

The template is attached. Please fill the content of your article into the template. If there is an **author information form** at the end of the article, please **delete the form**.

Please send me back before **July 28, 2023**.

Looking forward to your early reply.

SCOPE

Proceedings of the IEEE is the leading journal to provide in-depth review, survey, and tutorial coverage of the technical developments in electronics, electrical and computer engineering, and computer science. Consistently ranked as one of the top journals by Impact Factor, Article Influence Score and more, the journal serves as a trusted resource for engineers around the world. The Proceedings publishes approximately ten Special Issues and two regular paper issues per year. -Special Issues are led by distinguished Guest Editor teams and contain articles, typically surveys, reviews or tutorials, from leading experts in the technology area being covered. They serve as a guide to the state-of-the-art and are highly valued by the core research community, as well as specialists in other areas, looking to quickly come up to speed on the latest and more promising advances in areas outside of their own expertise. -Regular Issues consist of three to four papers on more focused topics, giving readers background and insight into emerging areas. Papers published in the Proceedings are usually reviews, surveys, or tutorials. -Reviews critically examine a technology, tracing its progress from its inception to the present—and perhaps into the future. -Surveys comprehensively view a technology—its applications, issues, ramifications, and potential. -Tutorial papers explain a technology and may give practical information for implementing it. These papers are written for the purpose of informing non-specialist engineers about a particular technology.

Abstract—This study verifies and checks the accuracy of luminance and illuminance from high dynamic range images (HDRI) generated by a commercial IP camera compared to measurement devices. The statistical analysis indicates that measuring luminance using the calibration method with a luminance meter is comparable with measurement results using a luminance meter, with average relative error in the range of 5–23%, whereas illuminance measurement using the equation method is in line with the measurement using an illuminance meter, with an average relative error range of 1–11%. Regarding the accuracy of the HDRI method, using digital cameras is in the range of 5–27%, which is still acceptable.

Keywords—high dynamic range images; luminance; illuminance; IP camera; view sensor

I. INTRODUCTION

Since the development of digital cameras and their utilization as luminance mapping tools using the High Dynamic Range Imaging (HDRI) technique [1], HDRI has been applied for lighting environment studies such as analyzing luminance, illuminance, and glare for visual comfort, generating illuminance maps, and controlling room lighting [2, 3]. To generate luminance maps from HDRI, several methods and software have been developed such as Radiance, Photosphere, hdrgen, hdrscope, and Devebec algorithms using MATLAB or Python [4–6].

Recent studies explore the use of HDRI using digital cameras for building automation and real-time lighting and window blind control systems. [7] introduced an HDR vision sensor for a lighting control system using a developed digital camera to maintain visual and thermal comfort as well as reduce energy consumption. [8] presented a low-cost, window-mounted HDRI sensor with a wide fisheye lens as a daylight glare control system. [9] presented control strategies for lighting energy saving while satisfying glare constraints by using a calibrated fisheye lens digital camera for validating luminance mapping and glare measurements.

Similar to digital cameras, commercial CCTV cameras or IP cameras can be used to create HDRI images. CCTV or IP cameras have been used for surveillance or monitoring human activities. Designed CCTV cameras integrated with central control system and PIR sensors have been used to monitor teachers' and students' performance in the classroom [10–11].

This research was supported by the Taiwan Ministry of Education and by the Taiwan Ministry of Science and Technology.

This paper presents a calibration and verification method for a commercial IP camera applied as a view sensor to generate illuminance and luminance values from HDRI.

II. METHODOLOGY

A. Experimental Setup

A 360-degree fisheye Vivotek FE8174/74V network security camera (IP camera) was used as a view sensor. It was capable of recording eight 1920x1920 pixel RGB images simultaneously at multiple exposures with shutter time starting from 1/5–1/32,000 s within one minute. Two experiments were conducted. In Experiment 1, the IP cam was installed horizontally and in Experiment 2, the IP cam was placed vertically at a height of 1.2 m (Fig. 1). In each experiment, six HDRI were created at different room brightness as dimmable LED lamps were used to provide different light brightness. During the experiment, a Konica Minolta LS-110 luminance meter and a Konica Minolta T-10/T-10M illuminance meter were used to calibrate and monitor the luminance and illuminance values, respectively. Eight papers were put on the floor (Fig. 1a and 1b) or desk and wall (Fig. 1c and 1d) as measurement points and one was used as the calibration point. The illuminance meter receptor units were placed next to each paper. Each measurement comprised 42 data points.

B. HDRI processing

An HDRI was created by merging eight low dynamic images using theDebevec algorithm [6, 12]. To calculate the luminance value, the following equation was used:

$$L_{pixel} = (0.265 * R + 0.67 * G + 0.065 * B) \quad (1)$$

where L_{pixel} = luminance value of the pixel (cd/m^2); R, G, and B = the spectrally weighted radiance of the pixel ($\text{W}/\text{m}^2 \text{ sr}$); and 0.265, 0.67, and 0.065 are calculated from CIE chromaticity used by Radiance [5, 13]. To obtain the luminance value of HDRI, a luminance meter was used to calibrate the luminance value of the pixels using the equation:

$$L_{HDRI} = L_{pixel} * k \quad (2)$$

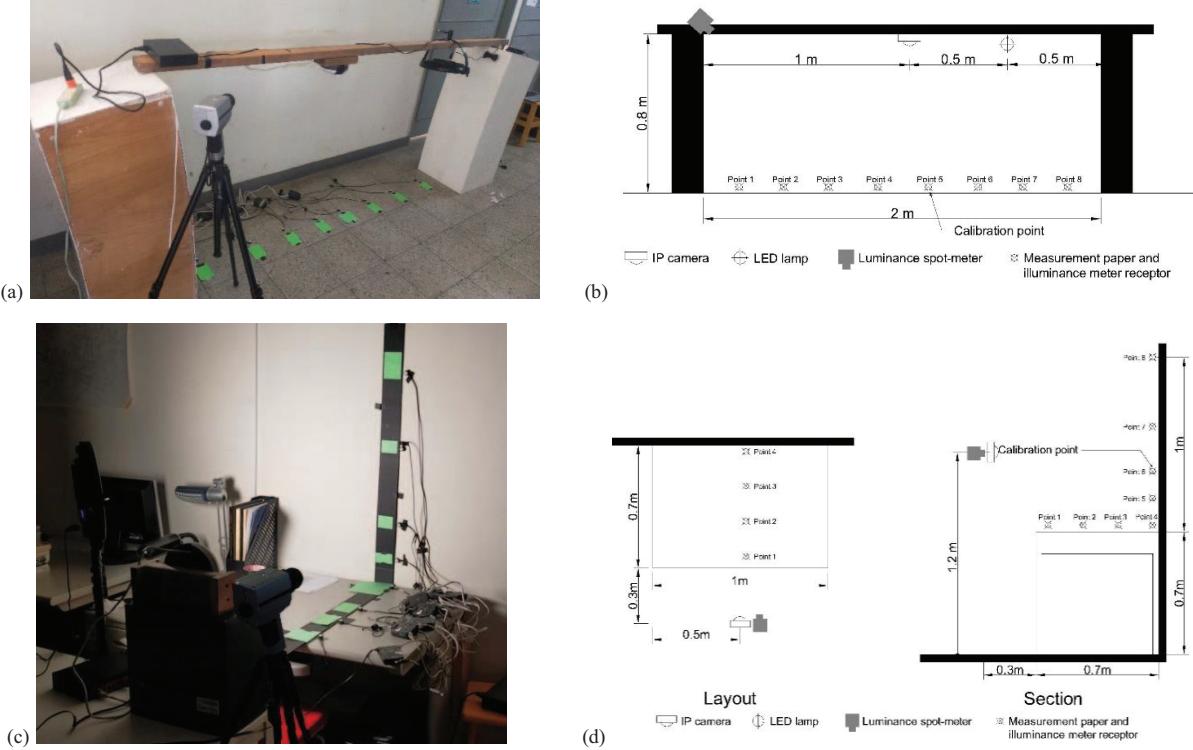

Fig. 1. (a) Experimental setup using an IP camera installed horizontally (Experiment 1); (b) Schematic representation of Experiment 1; (c) The IP camera was placed at the height of 1.2 m (Experiment 2); (d) Schematic representation of Experiment 2.

where k = calibration factor obtained from the luminance value of the luminance meter divided by the luminance value of the pixel determined as the calibration point. This calibration factor varies for each measurement. This method is called “Method 1.”

In addition to using a calibration factor to obtain the luminance value, another method using the equation proposed by [7] was used. To test the equation, six measurement data were used as training data and six additional measurements were obtained as test data. The equation solved using the training data was then used to obtain the HDRI luminance value of the test data. This method is called “Method 2.”

These two methods were used to obtain the HDRI illuminance value. For Method 1, the luminance value was converted using the equation:

$$E = (L/\rho) * \pi \quad (3)$$

where E = illuminance value (lux); L = luminance value of the pixel (cd/m^2); and ρ = reflectance of the surface, which was measured by Konica Minolta Spectrophotometer CM-2600d to be 0.657 [2]. For Method 2, the equation method proposed by [7] was used as explained earlier.

III. RESULT AND ANALYSIS

The luminance and illuminance values obtained from HDRI and measurements were compared using relative error according to the equation:

$$\text{Relative error} = \text{abs} [(M_{\text{HDRI}} - M_{\text{meas}}) / M_{\text{meas}}] * 100 \quad (4)$$

where M_{HDRI} = luminance/illuminance obtained from HDRI and M_{meas} = luminance/illuminance value measured using luminance/illuminance meter.

A. Experiment 1 Measurement Results

In Experiment 1, point 5 is used as the calibration point and not used for calculating the relative error. For Method 2, to obtain luminance and illuminance values from the HDRI, Table 3 and Table 4 in Appendix shows the R^2 ranges from 0.9869 to 0.9986 and from 0.9796 to 0.9993, respectively. The average relative error of luminance measurements compared to measurements using a luminance meter for Method 1 and Method 2 ranges from 7.19% to 23.06% and from 4.54% to 39.25%, respectively. The maximum relative error of Method 1 is 31.91%, recorded on point 4 in lighting condition 4 while for Method 2 it is 54.7%, recorded on point 8 in lighting condition 1 (Fig. 2). The average relative error of illuminance measurements compared to measurements using the illuminance meter for Method 1 and Method 2 ranges from 13.61% to 32.83% and from 1.42% to 11.54%, respectively. The maximum relative error of Method 1 is 50.43%, recorded on point 1 in lighting condition 5 while for Method 2 it is 22.74%, recorded on point 7 in lighting condition 4 (Fig. 3).

B. Experiment 2 Measurement Results

The calibration point used in Experiment 2 is point 6. In luminance measurement using Method 2, point 5 is eliminated

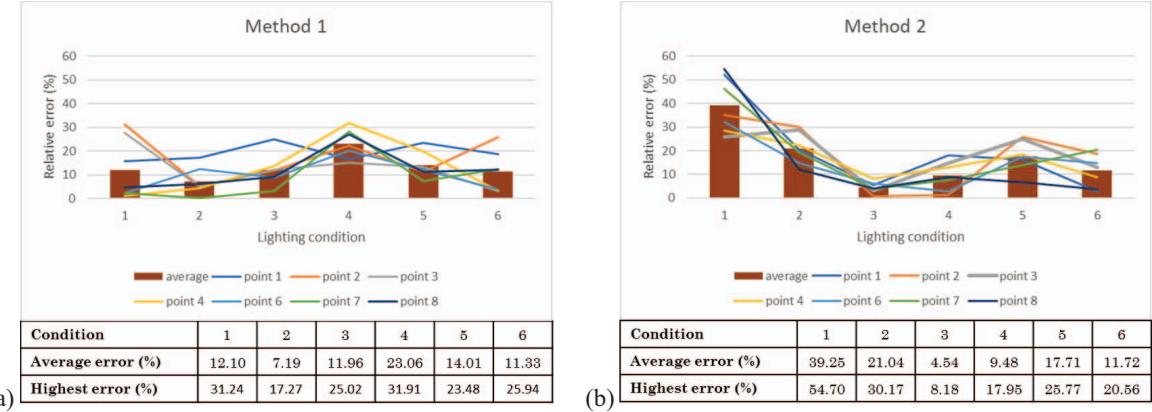

Fig. 2. Experiment 1 Measurement results: (a) Luminance average relative error using Method 1; (b) Luminance average relative error using Method 2.

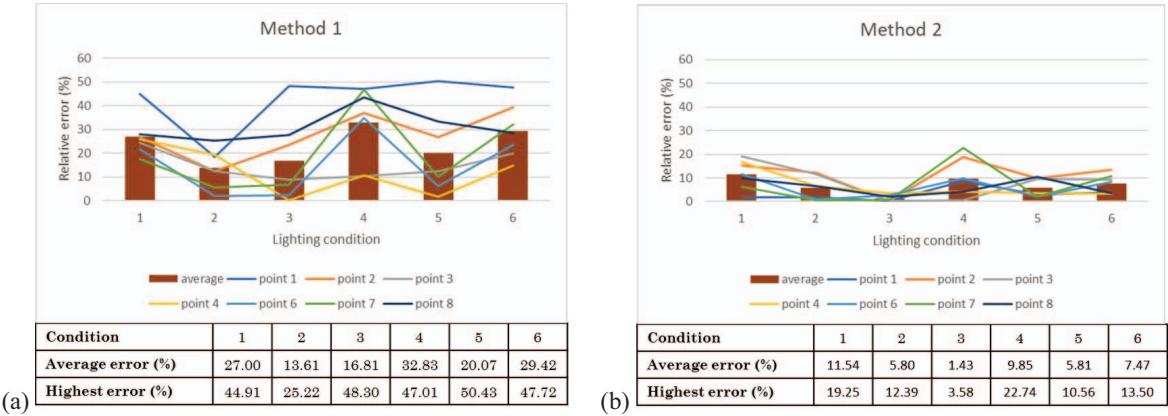

Fig. 3. Experiment 1 Measurement results: (a) Illuminance average relative error using Method 1; (b) Illuminance average relative error using Method 2.

and not used because the R^2 is 0.6454, whereas for the other points R^2 ranges from 0.9284 to 0.9891. In the illuminance measurement using Method 2, all points are used including point 5 as the R^2 ranges from 0.9248 to 0.9979 (Table 5 and Table 6 in Appendix). The average relative error of luminance measurements for Method 1 and Method 2 ranges from 5.39% to 11.87% and from 6.16% to 13.61%, respectively. The maximum relative error of Method 1 is 31.2%, recorded on point 4 in lighting condition 2 while for Method 2 it is 21.12%, recorded on point 2 in lighting condition 1 (Fig. 4). The average relative error of illuminance measurements for Method 1 and Method 2 ranges from 5.78% to 11.85% and from 2.59% to 11.96%, respectively. The maximum relative error of Method 1 is 25.41%, recorded on point 4 in lighting condition 2 while for Method 2 it is 21.85%, recorded on point 3 in lighting condition 1 (Fig. 5).

C. Paired Comparison Analysis

A paired comparison test [14] was used to observe any significant difference between the luminance and illuminance measurement values obtained by the IP cam experiment using Method 1 and Method 2 compared to values obtained using luminance and illuminance meters. Table 1 shows the t-test value of the luminance and illuminance results. With $n = 42$,

the t-critical value for a two-tailed test with $\alpha = 0.05$ is 2.019, except for the luminance measurement in Experiment 2 using Method 2, which only has $n = 36$, so the t-critical value is 2.030. Both Experiment 1 and Experiment 2 results indicate that luminance measurements using Method 2 prove that the two groups are significantly different as the t-test value is higher than the t-critical value. Conversely, Method 2 proves that the two groups of illuminance measurement are comparable, whereas measurements using Method 1 indicate a significant difference between HDRI generated by IP cam and illuminance measurement results.

TABLE I.
T-TEST VALUES OF LUMINANCE AND ILLUMINANCE FOR HDRI AND MEASUREMENT DEVICES

Measured	Method	Experiment 1 t-test value	Experiment 2 t-test value
Luminance	1	0.249	1.683
Luminance	2	4.917*	4.626*
Illuminance	1	5.576*	2.035*
Illuminance	2	1.144	0.875

*t-test value higher than t-critical value

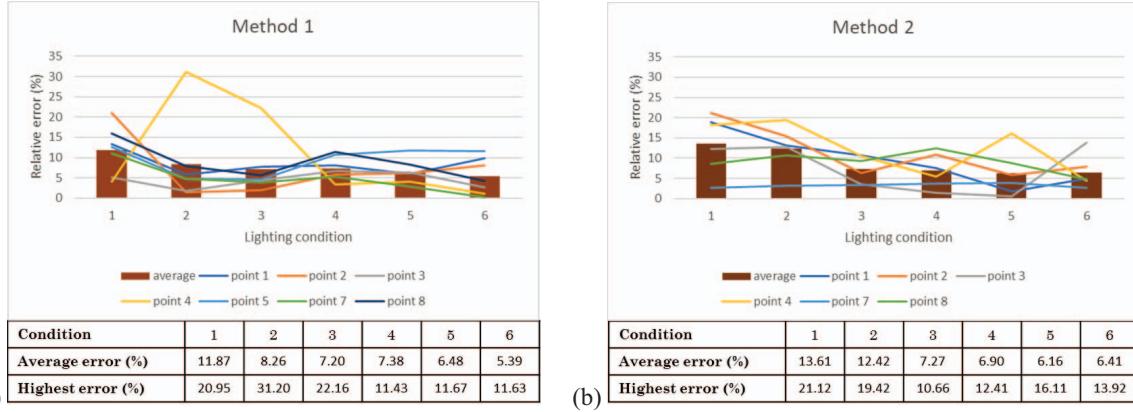

Fig. 4. Experiment 2 Measurement results: (a) Luminance average relative error using Method 1; (b) Illuminance average relative error using Method 2.

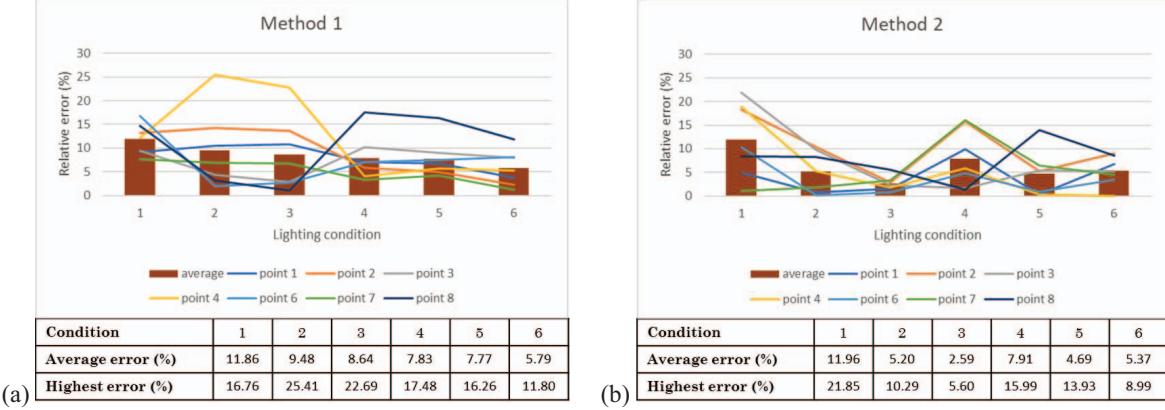

Fig. 5. Experiment 2 Measurement results: (a) Illuminance average relative error using Method 1; (b) Illuminance average relative error using Method 2.

IV. DISCUSSION AND CONCLUSION

Paired analysis indicates that luminance measurements using Method 1 and illuminance measurements using Method 2 are comparable. Table 2 shows the average relative error of luminance measurements using Method 1 and illuminance measurements using Method 2. The average relative error of luminance and illuminance measurement ranges from 5.39% to 23.06% and from 1.42% to 1.96%, respectively, which is still acceptable for an HDRI measurement device with accuracy ranging from 5% to 27% [15-16]. Although the luminance measurement maximum error recorded in Measurement 1/Method 1 is higher than 30%, the average relative error is still acceptable and there is no significant difference between HDRI and the measurement devices.

TABLE II. AVERAGE RELATIVE ERROR BETWEEN HDRI AND MEASUREMENT DEVICES

Measured	Method	Average Relative Error	
		Experiment 1	Experiment 2
Luminance	1	7.19%–23.06%	5.39%–11.87%
Illuminance	2	1.42%–11.54%	2.59%–11.96%

The results indicate that a commercial IP camera can be used as a view sensor although there is some limitation related to accuracy. To obtain luminance values from HDRI, Method 1 (calibration method) is more accurate compared to Method 2 (equation method).

APPENDIX

TABLE III. LUMINANCE EQUATION IN EXPERIMENT 1

Point	Luminance Equation	R ²
1	$L_{\text{HDRI}} = 1.2371 * L_{\text{pixel}} + 0.392$	0.993
2	$L_{\text{HDRI}} = 1.2579 * L_{\text{pixel}} - 7.225$	0.9872
3	$L_{\text{HDRI}} = 0.8704 * L_{\text{pixel}} + 1.747$	0.9986
